# Stochastic tamed Navier-Stokes equations on $\mathbb{R}^{3}$ : the existence and the uniqueness of solutions and the existence of an invariant measure 

Zdzisław Brzeźniak and Gaurav Dhariwal<br>University of York and Vienna University of Technology

#### Abstract

Röckner and Zhang in [31] proved the existence of a unique strong solution to a stochastic tamed 3D Navier-Stokes equation in the whole space and for the periodic boundary case using a result from [36]. In the latter case, they also proved the existence of an invariant measure. In this paper, we improve their results (but for a slightly simplified system) using a self-contained approach. In particular, we generalise their result about an estimate on the $L^{4}$-norm of the solution from the torus to $\mathbb{R}^{3}$, see Lemma 5.1 and thus establish the existence of an invariant measure on $\mathbb{R}^{3}$ for a time-homogeneous damped tamed 3D Navier-Stokes equation, given by (6.1).

Mathematics Subject Classification (2010). Primary 60H15; Secondary 35R60, 35Q30, 76D05.

Keywords. Stochastic tamed Navier-Stokes equations, stochastic damped Navier-Stokes equations, invariant measures.

## 1. Introduction

In the present paper we study the stochastic tamed Navier-Stokes equations (NSEs) on $\mathbb{R}^{3}$ which were introduced by Röckner and Zhang [31, 32]. We consider the following stochastic tamed NSEs with viscosity $\nu,(t, x) \in[0, T] \times$ $\mathbb{R}^{3}$

[^0]\[

$$
\begin{align*}
d u(t, x)= & {[\nu \Delta u(t, x)-(u(t, x) \cdot \nabla) u(t, x)-\nabla p(t, x)] d t } \\
& -\left[g\left(|u(t, x)|^{2}\right) u(t)-f(x, u(t, x))\right] d t \\
& +\sum_{j=1}^{\infty}\left[\left(\sigma_{j}(t, x) \cdot \nabla\right) u(t)+\nabla \widetilde{p}_{j}(t, x)\right] d W_{t}^{j} \tag{1.1}
\end{align*}
$$
\]

subject to the incompressibility condition

$$
\begin{equation*}
\operatorname{div} u(t)=0, \quad t \geq 0 \tag{1.2}
\end{equation*}
$$

and the initial condition

$$
\begin{equation*}
u(0, x)=u_{0}(x), \quad x \in \mathbb{R}^{3} \tag{1.3}
\end{equation*}
$$

where $p(t, x)$ and $\widetilde{p}_{j}(t, x)$ are unknown scalar functions.
We assume that the taming function $g: \mathbb{R}_{+} \rightarrow \mathbb{R}_{+}$is smooth and satisfies, for some $N \in \mathbb{N}$, the following condition

$$
\begin{cases}g(r)=0, & \text { if } r \leq N,  \tag{1.4}\\ g(r)=(r-N) / \nu, & \text { if } r \geq N+1 \\ 0 \leq g^{\prime}(r) \leq 2 /(\nu \wedge 1), & r \in[N, N+1]\end{cases}
$$

Finally we assume that $\left\{W_{t}^{j} ; t \geq 0, j=1,2, \ldots\right\}$ is a sequence of independent one-dimensional standard $\mathbb{F}=\left(\mathcal{F}_{t}\right)_{t \geq 0}$-Brownian motions on a complete filtered probability space $(\Omega, \mathcal{F}, \mathbb{F}, \mathbb{P})$. The stochastic integral is understood as the Itô integral. The drift and diffusion coefficients are given as follows:

$$
\begin{array}{r}
\mathbb{R}^{3} \times \mathbb{R}^{3} \ni(x, u) \mapsto f(x, u) \in \mathbb{R}^{3} \\
\mathbb{R}_{+} \times \mathbb{R}^{3} \ni(t, x) \mapsto \sigma(t, x) \in \mathbb{R}^{3} \times \ell^{2}
\end{array}
$$

where $\ell^{2}$ denotes the standard Hilbert space consisting of all square summable sequences of real numbers endowed with standard norm $\|\cdot\|_{\ell^{2}}$. In the following $f$ and $\sigma$ are always assumed to be measurable with respect to all their variables.

In the case of classical deterministic Navier-Stokes equations on $\mathbb{R}^{3}$, if the initial data $u_{0} \in \mathrm{~V}$ (see Section 2), then there exists only a local strong solution, see [37]. Cai and Jiu [12] studied the Navier-Stokes equations with damping on $\mathbb{R}^{3}$, where the damping was modeled by the term $|u|^{\beta-1} u, \beta \geq 1$; the tamed term considered in the current paper corresponds to $\beta=3$. They proved the existence of a global weak solution ${ }^{1}$ for any $\beta \geq 1$ and $u_{0} \in \mathrm{H}$, see Section 2 and they proved the existence of a global strong solution ${ }^{2}$ for $\beta \geq 7 / 2$ and $u_{0} \in \mathrm{~V} \cap L^{\beta+1}$. Moreover, they were able to show the uniqueness of strong solutions for $7 / 2 \leq \beta \leq 5$. Later, Zhang et al. [42], by exploiting the Gagliardo-Nirenberg inequality, were able to lower down the parameter

[^1]$\beta$ to 3. Thus, establishing the existence of a global strong solution to NavierStokes equations with damping on $\mathbb{R}^{3}$ for $\beta>3, u_{0} \in \mathrm{~V} \cap L^{\beta+1}$ and proving uniqueness whenever $3<\beta \leq 5$. They also remarked that the critical value for $\beta$ is $\beta=3$ [42, Remark 3.1]. But, Zhou [43, Theorem 2.1] was able to surpass this critical value of $\beta$.

Moreover, for any $\beta \geq 1$, he proved that the strong solution is unique in a larger class of weak solutions, see [43, Theorem 3.1]. The critical case of $\beta=3$ was studied by Röckner and Zhang [32, Theorem 1.1], where they proved the existence of a smooth unique global solution to the deterministic tamed 3D Navier-Stokes equations for very smooth initial data and deterministic forcing $f$. Moreover, they proved [32, Theorem 1.1] that this unique solution converges (in $L^{2}\left(0, T ; L^{2}(\mathcal{O})\right)$ ) to a bounded Leray-Hopf solution of 3D Navier-Stokes equations (if exists) on a bounded domain $\mathcal{O} \subset \mathbb{R}^{3}$. The non-explosion of the solution is due to the tamed term. Röckner and Zhang [33] also studied 3D tamed Navier-Stokes equations on a bounded domain $\mathcal{O} \subset \mathbb{R}^{3}$ with Dirichlet boundary conditions and proved the existence of a unique strong solution directly, based on the Galerkin approximation and on a kind of local monotonicity of the coefficients. Recently, You [41] proved the existence of a random attractor for the 3D damped ( $|u|^{\beta-2} u$ ) Navier-Stokes equations with additive noise for $4<\beta \leq 6$ with initial data $u_{0} \in \mathrm{~V}$ on a bounded domain $\mathcal{O} \subset \mathbb{R}^{3}$ with smooth boundary.

Röckner and Zhang [31] proved the existence of a strong solution of the stochastic tamed NSEs (in probabilisitc sense) by invoking the YamadaWatanabe theorem, thus proving the existence of a martingale solution to (1.1) (with more generalised noise term) in the absence of compact Sobolev embeddings and the pathwise uniqueness. They used the localization method to prove the tightness, a method introduced by Stroock and Varadhan [36]. In this paper, we present a self-contained proof of the same result. In order to prove the existence of a martingale solution, Röckner et al. used the FaedoGalerkin approximation with the non-classical finite dimensional space $H_{n}^{1}=$ $\operatorname{span}\left\{e_{i}, i=1 \cdots n\right\}$ where $\mathcal{E}=\left\{e_{i}\right\}_{i \in \mathbb{N}} \subset \mathcal{V}$ (see Section 2) is the orthonormal basis of $H^{1}$. They also require that in the case of the periodic boundary conditions, $\mathcal{E}$ is an orthogonal basis of $H^{0}$ which was essential in obtaining the $L^{4}$-estimate of the solution. We generalised this result to $\mathbb{R}^{3}$. Another reason for Röckner et al. to choose the periodic boundary conditions is the compactness of $H^{2} \hookrightarrow H^{1}$ embedding, which along with the $L^{4}$-estimate of the solution was crucial in establishing the existence of invariant measures. We don't require this embedding and hence are able to obtain the existence of invariant measures for the damped tamed Navier-Stokes equations on $\mathbb{R}^{3}$.

In the present paper we prove the existence of a unique strong solution to the stochastic tamed 3D Navier-Stokes equation (1.1) under some natural assumptions (H1) - (H2) on the drift $f$ and the diffusion $\sigma$ (see Section 2). To prove the existence of strong solution we use the Yamada-Watanabe theorem $[28,40]$ which states that the existence of martingale solutions plus pathwise
uniqueness implies the existence of a unique strong solution. In order to establish the existence of martingale solutions, instead of using the standard Faedo-Galerkin approximations we use a different approach motivated from [16] and [21]. We study a truncated SPDE on an infinite dimensional space $\mathrm{H}_{n}$, defined in the Section 4 and then use the tightness criterion, Jakubowski's generalisation of the Skorohod's theorem and the martingale representaion theorem to prove the existence of martingale solutions. The essential reason for us to incorporate this approximation scheme, is the non-commutativity of gradient operator $\nabla$ with the standard Faedo-Galerkin projection operator $P_{n}[5$, Section 5]. The commutativity is essential for us to obtain a'priori bounds. We also prove the existence of invariant measures, Theorem 6.1, for time homogeneous damped tamed Navier-Stokes equations 6.1 under the assumptions (H1) $-(\mathbf{H} 3)^{\prime}$ (see Section 6). We use the technique (Theorem 6.4) of Maslowski and Seidler [23], see also [6, 10], working with weak topologies to establish the existence of invariant measures. We show the two conditions of Theorem 6.4, boundedness in probability and sequentially weakly Feller property are satisfied for the semigroup $\left(T_{t}\right)_{t \geq 0}$, defined by (6.2). In contrast to the paper by Röckner and Zhang [31], a'priori bound on $L^{4}$-norm of the solution plays an essential role in the existence of martingale solutions and not in the existence of invariant measures.

This paper is organised as follows. In Section 2, we recall some standard notations and results and set the assumptions on $f$ and $\sigma$. We also establish certain estimates on the tamed term which we use later in Sections 4 and 5. We end the section by recalling a generalised version of the Gronwall Lemma for random variables from [15]. In Section 3, we establish the tightness criterion and state the Jakubowski's generalisation of Skorohod theorem which we use along with a'priori estimates obtained in the Section 5 to prove the existence of a martingale solution and path-wise uniqueness of the solution. In Section 4, we introduce our truncated SPDEs and describe the approximation scheme motivated by $[16,21]$, along with all the machinery required. Finally, in Section 6 we establish the existence of an invariant measure for damped tamed 3D Navier-Stokes equations (6.1).

## 2. Functional setting

### 2.1. Notations and basic definitions

Let $\left(X,\|\cdot\|_{X}\right),\left(Y,\|\cdot\|_{Y}\right)$ be two real normed spaces. The space of all bounded linear operators from $X$ to $Y$ is denoted by $\mathcal{L}(X, Y)$. If $Y=\mathbb{R}$, then $X^{\prime}:=$ $\mathcal{L}(X, \mathbb{R})$ is called the dual space of $X$. The standard duality pairing is denoted by $X^{\prime}\langle\cdot, \cdot\rangle_{X}$. If both spaces are separable Hilbert then by $\mathcal{L}_{2}(Y ; X)$ we will denote the space of all Hilbert-Schmidt operators from $Y$ to $X$ endowed with the standard norm $\|\cdot\|_{\mathcal{L}_{2}(Y ; X)}$.

Assume that $X, Y$ are Hilbert spaces with scalar products $\langle\cdot, \cdot\rangle_{X}$ and $\langle\cdot, \cdot\rangle_{Y}$ respectively. For a densely defined linear operator $A: D(A) \rightarrow Y$, $D(A) \subset X$, by $A^{*}$ we denote the adjoint operator of $A$. In particular, $D\left(A^{*}\right) \subset$
$Y, A^{*}: D\left(A^{*}\right) \rightarrow X$ and

$$
\langle A x, y\rangle_{Y}=\left\langle x, A^{*} y\right\rangle_{X}, \quad x \in D(A), y \in D\left(A^{*}\right) .
$$

Note that $D\left(A^{*}\right)=Y$ if $A$ is bounded.
Let $C_{0}^{\infty}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$ denote the set of all smooth functions from $\mathbb{R}^{3}$ to $\mathbb{R}^{3}$ with compact supports. For $p \in[1, \infty]$ the Lebesgue spaces of $\mathbb{R}^{3}$-valued functions will be denoted by $L^{p}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$, and often by $L^{p}$ whenever the context is understood. If $p=2$, then $L^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$ is a Hilbert space with the scalar product given by

$$
\langle u, \mathrm{v}\rangle_{L^{2}}:=\int_{\mathbb{R}^{3}} u(x) \cdot \mathrm{v}(x) d x, \quad u, \mathrm{v} \in L^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)
$$

We define, see [38], the Bessel potential space $H^{s, p}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$ for $s \geq 0$ and $p \in(1, \infty)$ as the space of all $\mathbb{R}^{3}$-valued functions $u \in L^{p}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$ such that $(1-\Delta)^{s / 2} u \in L^{p}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$, where $\Delta$ is the Laplace operator in $\mathbb{R}^{3}$. In particular, $H^{1}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right):=H^{1,2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$ is the space of all $u \in L^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$ for which the weak derivatives $D_{i} u \in L^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right), i=1, \ldots, 3 . H^{1}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$ is a Hilbert space with the scalar product given by

$$
\langle u, \mathrm{v}\rangle_{H^{1}}:=\langle u, \mathrm{v}\rangle_{L^{2}}+((u, \mathrm{v})), \quad u, \mathrm{v} \in H^{1}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right),
$$

where

$$
\begin{equation*}
((u, \mathrm{v})):=\langle\nabla u, \nabla \mathrm{v}\rangle_{L^{2}}=\sum_{i=1}^{3} \int_{\mathbb{R}^{3}} \frac{\partial u}{\partial x_{i}} \cdot \frac{\partial \mathrm{v}}{\partial x_{i}} d x, \quad u, \mathrm{v} \in H^{1}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right) \tag{2.1}
\end{equation*}
$$

Finally, for $s \geq 0$, the space $H^{s, 2}=: H^{s}$ is also a Hilbert space endowed with the norm

$$
\|u\|_{H^{s}}=\left[\int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)^{s}|\hat{u}(\xi)|^{2} d \xi\right]^{1 / 2}
$$

where $\hat{u}$ denotes the Fourier transform of a tempered distribution $u$.
Let

$$
\begin{aligned}
& \mathcal{V}:=\left\{u \in C_{0}^{\infty}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right): \operatorname{div} \mathrm{u}=0\right\}, \\
& \mathrm{H}:=\text { the closure of } \mathcal{V} \text { in } L^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right), \\
& \mathrm{V}:=\text { the closure of } \mathcal{V} \text { in } H^{1}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right), \\
& \mathrm{D}(\mathrm{~A}):=\mathrm{H} \cap \mathrm{H}^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right), \quad \mathrm{Au}:=\Pi(-\Delta \mathrm{u}), \quad \mathrm{u} \in \mathrm{D}(\mathrm{~A}),
\end{aligned}
$$

where $\Pi$ is the orthogonal projection from $L^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$ to $H$. It is known, see e.g. [18], that $\Pi=\left(1-D_{i} D_{j} \Delta^{-1}\right)_{i, j=1}^{3}$ is a pseudodifferential operator with matrix symbol $\left(\delta_{i, j}-D_{i} D_{j} \Delta^{-1}\right)_{i, j=1}^{3} ; \Pi$ is a bounded linear operator in $H^{s, p}\left(\mathbb{R}^{3}\right)$ by the Marcinkiewicz-Mihlin Theorem [22, 26], for all $s \in \mathbb{R}$ and a $p \in(1, \infty)$.

On H we consider the scalar product and the norm inherited from $L^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$ and denote them by $\langle\cdot, \cdot\rangle_{\mathrm{H}}$ and $|\cdot|_{\mathrm{H}}$ respectively, i.e.

$$
\langle u, \mathrm{v}\rangle_{\mathrm{H}}:=\langle u, \mathrm{v}\rangle_{L^{2}}, \quad|u|_{\mathrm{H}}:=|u|_{L^{2}}, \quad u, \mathrm{v} \in \mathrm{H} .
$$

On V we consider the scalar product and norm inherited from $H^{1}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$, i.e.

$$
\begin{equation*}
\langle u, \mathrm{v}\rangle_{\mathrm{V}}:=\langle u, \mathrm{v}\rangle_{L^{2}}+((u, \mathrm{v})), \quad\|u\|_{\mathrm{V}}^{2}:=|u|_{\mathrm{H}}^{2}+|\nabla u|_{L^{2}}^{2}, \quad u, \mathrm{v} \in \mathrm{~V} \tag{2.2}
\end{equation*}
$$

where $((\cdot, \cdot))$ is defined in $(2.1) . \mathrm{D}(\mathrm{A})$ is a Hilbert space under the graph norm

$$
|u|_{\mathrm{D}(\mathrm{~A})}^{2}:=|u|_{\mathrm{H}}^{2}+|\mathrm{A} u|_{L^{2}}^{2}, \quad u \in \mathrm{D}(\mathrm{~A})
$$

where the inner product is given by

$$
\langle u, \mathrm{v}\rangle_{\mathrm{D}(\mathrm{~A})}:=\langle u, \mathrm{v}\rangle_{\mathrm{H}}+\langle\mathrm{A} u, \mathrm{Av}\rangle_{L^{2}}, \quad u, \mathrm{v} \in \mathrm{D}(\mathrm{~A})
$$

### 2.2. Some operators

Let us consider the following tri-linear form

$$
\begin{equation*}
b(u, w, \mathrm{v})=\int_{\mathbb{R}^{3}}(u \cdot \nabla w) \mathrm{v} d x \tag{2.3}
\end{equation*}
$$

defined for suitable vector fields $u, \mathrm{v}, w$ on $\mathbb{R}^{3}$. We will recall the fundamental properties of the form $b$ which are valid in unbounded domains.

By the Sobolev embedding theorem and Hölder inequality, we obtain the following estimates

$$
\begin{align*}
|b(u, w, \mathrm{v})| & \leq\|u\|_{L^{4}}\|w\|_{\mathrm{V}}\|\mathrm{~V}\|_{L^{4}}, \quad u, \mathrm{v} \in L^{4}, w \in \mathrm{~V}  \tag{2.4}\\
& \leq c\|u\|_{\mathrm{V}}\|w\|_{\mathrm{V}}\left\|_{\mathrm{V}}\right\|_{\mathrm{V}}, \quad u, \mathrm{v}, w \in \mathrm{~V} \tag{2.5}
\end{align*}
$$

for some positive constant $c$. Thus the form $b$ is continuous on V. Moreover, if we define a bilinear map $B$ by $B(u, w):=b(u, w, \cdot)$, then by inequality (2.5) we infer that $B(u, w) \in \mathrm{V}^{\prime}$ for all $u, w \in \mathrm{~V}$ and that the following inequality holds

$$
\begin{equation*}
|B(u, w)|_{\mathrm{V}^{\prime}} \leq c\|u\|_{\mathrm{V}}\|w\|_{\mathrm{V}}, \quad u, w \in \mathrm{~V} \tag{2.6}
\end{equation*}
$$

Moreover, the mapping $B: \mathrm{V} \times \mathrm{V} \rightarrow \mathrm{V}^{\prime}$ is bilinear and continuous.
Let us, for any $s>0$, define the following standard scale of Hilbert spaces

$$
\begin{equation*}
\mathrm{V}_{s}:=\text { the closure of } \mathcal{V} \text { in } H^{s}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right) \tag{2.7}
\end{equation*}
$$

If $s>\frac{d}{2}+1$ then by the Sobolev Embedding theorem,

$$
\begin{equation*}
H^{s-1}\left(\mathbb{R}^{d} ; \mathbb{R}^{3}\right) \hookrightarrow C_{b}\left(\mathbb{R}^{d} ; \mathbb{R}^{3}\right) \hookrightarrow L^{\infty}\left(\mathbb{R}^{d} ; \mathbb{R}^{3}\right) \tag{2.8}
\end{equation*}
$$

Here $C_{b}\left(\mathbb{R}^{d} ; \mathbb{R}^{3}\right)$ denotes the space of continuous and bounded $\mathbb{R}^{3}$-valued functions defined on $\mathbb{R}^{d}$. If $u, w \in \mathrm{~V}$ and $\mathrm{v} \in \mathrm{V}_{s}$ with $s>\frac{3}{2}$ then

$$
|b(u, w, \mathrm{v})|=|b(u, \mathrm{v}, w)| \leq|u|_{L^{2}}|w|_{L^{2}}\|\nabla \mathrm{v}\|_{L^{\infty}} \leq c|u|_{L^{2}}|w|_{L^{2}}\|\mathrm{v}\|_{\mathrm{V}_{s}}
$$

for some constant $c>0$. Thus $b$ can be uniquely extended to the tri-linear form (denoted by the same letter)

$$
b: \mathrm{H} \times \mathrm{H} \times \mathrm{V}_{s} \rightarrow \mathbb{R}
$$

and

$$
|b(u, w, \mathrm{v})| \leq c|u|_{L^{2}}|w|_{L^{2}}\|\mathrm{v}\|_{\mathrm{V}_{s}}, \quad u, w \in \mathrm{H}, \mathrm{v} \in \mathrm{~V}_{s}
$$

At the same time, the operator $B$ can be uniquely extended to a bounded linear operator

$$
B: \mathrm{H} \times \mathrm{H} \rightarrow \mathrm{~V}_{s}^{\prime}
$$

In particular, it satisfies the following estimate

$$
\begin{equation*}
|B(u, w)|_{\mathrm{V}_{s}^{\prime}} \leq c|u|_{\mathrm{H}}|w|_{\mathrm{H}}, \quad u, w \in \mathrm{H}, \quad s>\frac{3}{2} \tag{2.9}
\end{equation*}
$$

We will also use the following notation, $B(u):=B(u, u)$.
Let us assume that $s>1$. It is clear that $\mathrm{V}_{s}$ is dense in V and the embedding $j_{s}: \mathrm{V}_{s} \hookrightarrow \mathrm{~V}$ is continuous. Then there exists [8, Lemma C.1] a Hilbert space $U$ such that $U \subset \mathrm{~V}_{s}, U$ is dense in $\mathrm{V}_{s}$ and
the natural embedding $i_{s}: U \hookrightarrow \mathrm{~V}_{s}$ is compact.
Therefore, the following embedding of the spaces hold

$$
\mathrm{U} \hookrightarrow \mathrm{~V}_{s} \hookrightarrow \mathrm{~V} \hookrightarrow \mathrm{H} \equiv \mathrm{H}^{\prime} \hookrightarrow \mathrm{U}^{\prime}
$$

The following Gagliardo-Nirenberg interpolation inequality will be used frequently. Let $q \in[1, \infty]$ and $m \in \mathbb{N}$. If

$$
\frac{1}{q}=\frac{1}{2}-\frac{m \alpha}{3}, \quad 0 \leq \alpha \leq 1
$$

then there exists a constant $C_{m, q}$ depending on $m$ and $q$ such that

$$
\begin{equation*}
\|u\|_{L^{q}} \leq C_{m, q}\|u\|_{H^{m}}^{\alpha}|u|_{L^{2}}^{1-\alpha}, \quad \text { for } u \in H^{m} \tag{2.10}
\end{equation*}
$$

Recall that $\Pi$ is the orthogonal projection from $L^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$ to $H$. For any $u \in \mathrm{H}$ and $\mathrm{v} \in L^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)$, we have

$$
\langle u, \mathrm{v}\rangle_{\mathrm{H}}:=\langle u, \Pi \mathrm{v}\rangle_{\mathrm{H}}=\langle u, \mathrm{v}\rangle_{L^{2}} .
$$

The Stokes operator $\mathrm{A}: \mathrm{D}(\mathrm{A}) \rightarrow \mathrm{H}$, is given by

$$
\begin{aligned}
\mathrm{A} u & =-\Pi(\Delta u), \quad u \in \mathrm{D}(\mathrm{~A}), \\
\mathrm{D}(\mathrm{~A}) & =\mathrm{H} \cap H^{2}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right)
\end{aligned}
$$

### 2.3. Assumptions

We now introduce the following assumptions on the coefficients $f$ and $\sigma$ :
(H1) $f: \mathbb{R}^{3} \times \mathbb{R}^{3} \rightarrow \mathbb{R}^{3}$ is a continuous function such that there exists a constant $C_{f}>0$ and $b_{f} \in L^{1}\left(\mathbb{R}^{3}\right)$ such that for all $x \in \mathbb{R}^{3}, u \in \mathbb{R}^{3}$,

$$
|f(x, u)|^{2} \leq C_{f}|u|^{2}+b_{f}(x)
$$

Moreover, for $u_{1}, u_{2} \in \mathbb{R}^{3}$

$$
\left|f\left(x, u_{1}\right)-f\left(x, u_{2}\right)\right| \leq C_{f}\left|u_{1}-u_{2}\right|, \quad \forall x \in \mathbb{R}^{3}
$$

(H2) A measurable function $\sigma:[0, \infty) \times \mathbb{R}^{3} \rightarrow \ell^{2}$ of $C^{1}$ class with respect to the $x$-variable and for any $T>0$ there exists a constant $C_{\sigma, T}>0$ such that for all $t \in[0, T], x \in \mathbb{R}^{3}$

$$
\left\|\partial_{x^{j}} \sigma(t, x)\right\|_{\ell^{2}} \leq C_{\sigma, T}, \quad j=1,2,3
$$

and, for all $t \in[0, \infty), x \in \mathbb{R}^{3}$,

$$
\begin{equation*}
\|\sigma(t, x)\|_{\ell^{2}}^{2} \leq \frac{1}{4} \tag{2.11}
\end{equation*}
$$

Below for the sake of simplicity the variable " $x$ " in the coefficients will be dropped.

Define, for $j \in \mathbb{N}$, a map $G_{j}:[0, T] \times \mathrm{H} \rightarrow \mathrm{H}$ by

$$
\begin{equation*}
G_{j}(t, u):=\Pi\left[\left(\sigma_{j}(t) \cdot \nabla\right) u\right] . \tag{2.12}
\end{equation*}
$$

Then $G: \mathrm{H} \rightarrow \mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)$ is given by

$$
\begin{equation*}
G(u)(k)=\sum_{j=1}^{\infty} k_{j} G_{j}(u), \quad u \in \mathrm{H}, k \in \ell^{2} . \tag{2.13}
\end{equation*}
$$

Let $\left\{e_{j}\right\}_{j=1}^{\infty}$ be the orthonormal basis of $\ell^{2}$ then

$$
G(t, u)\left(e_{j}\right)=G_{j}(u), \quad t \geq 0, u \in \mathrm{H}
$$

For simplicity we will assume that $\nu=1$. In particular, the function $g$ defined by (1.4) will from now on be given by

$$
\left\{\begin{array}{lc}
g(r)=0, & \text { if } r \leq N  \tag{2.14}\\
g(r)=(r-N), & \text { if } r \geq N+1 \\
0 \leq g^{\prime}(r) \leq 2, & r \in[N, N+1]
\end{array}\right.
$$

Observe that the function $g$ defined in this way satisfies

$$
\begin{equation*}
|g(r)| \leq r, \quad r \geq 0 \tag{2.15}
\end{equation*}
$$

and

$$
\begin{equation*}
\left|g(r)-g\left(r^{\prime}\right)\right| \leq 2\left|r-r^{\prime}\right|, \quad r, r^{\prime} \geq 0 \tag{2.16}
\end{equation*}
$$

We are interested in proving the existence of solutions to (1.1) - (1.3). In particular, we want to prove the existence of a random divergence free vector field $u$ and scalar pressure $p$ satisfying (1.1) and (1.3). Thus we project equation (1.1) using the orthogonal projection operator $\Pi$ on the space $H$ of the $L^{2}$-valued, divergence free vector fields. On projecting, we obtain the following abstract stochastic evolution equation:

$$
\left\{\begin{align*}
d u(t)= & {\left[-\mathrm{A} u(t)-B(u(t))-\Pi\left[g\left(|u(t)|^{2}\right) u(t)\right]+\Pi f(u(t))\right] d t }  \tag{2.17}\\
& \quad+\sum_{j=1}^{\infty} G_{j}(t, u(t)) d W^{j}(t) \\
u(0)= & u_{0}
\end{align*}\right.
$$

where we assume that $u_{0} \in \mathrm{~V}$ and $W(t)=\left(W^{j}(t)\right)_{j=1}^{\infty}$ is a cylindrical Wiener process on $\ell^{2}$ and $\left\{W^{j}(t), t \geq 0, j \in \mathbb{N}\right\}$ is an infinite sequence of independent standard Brownian motions. We will repeatedly use the following notation

$$
G(t, u) d W(t):=\sum_{j=1}^{\infty} G_{j}(t, u) d W^{j}(t)
$$

We will need the following lemma later to obtain the a'priori estimates.
Lemma 2.1. i) For any $u \in \mathrm{D}(\mathrm{A})$

$$
\begin{equation*}
\left|\langle B(u), u\rangle_{\mathrm{V}}\right| \leq \frac{1}{2}|u|_{\mathrm{D}(\mathrm{~A})}^{2}+\frac{1}{2}| | u|\cdot| \nabla u \|_{L^{2}}^{2} . \tag{2.18}
\end{equation*}
$$

ii) If $u \in \mathrm{H}$, then

$$
\left\{\begin{array}{l}
\left(\left(-g\left(|u|^{2}\right) u, u\right)\right) \leq C_{N}|\nabla u|_{L^{2}}^{2}-2| | u|\cdot| \nabla u \|_{L^{2}}^{2}  \tag{2.19}\\
\left\langle-g\left(|u|^{2}\right) u, u\right\rangle_{L^{2}} \leq-\|u\|_{L^{4}}^{4}+C_{N}|u|_{\mathrm{H}}^{2},
\end{array}\right.
$$

where $((\cdot, \cdot))$ is defined in (2.1) and $C_{N}>0$ is a generic constant depending on $N$.
iii) If $T>0$ then $\exists C_{\sigma, T}>0$ such that for any $t \in[0, T]$ and $u \in \mathrm{D}(\mathrm{A})$,

$$
\begin{align*}
\|G(t, u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} & \leq \frac{1}{4}|\nabla u(t)|_{L^{2}}^{2}  \tag{2.20}\\
\|G(t, u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{V}\right)}^{2} & \leq \frac{1}{2}|\mathrm{~A} u(t)|_{L^{2}}^{2}+C_{\sigma, T}|\nabla u(t)|_{L^{2}}^{2} \tag{2.21}
\end{align*}
$$

Proof. Let $u \in \mathrm{D}(\mathrm{A})$. Since $\langle B(u), u\rangle_{\mathrm{H}}=0$, using the Cauchy-Schwarz and the Young's inequality we get

$$
\begin{aligned}
& \left|\langle B(u), u\rangle_{\mathrm{V}}\right|=\left|\langle B(u),(I-\Delta) u\rangle_{\mathrm{H}}\right| \leq|-\Delta u|_{L^{2}}|(u \cdot \nabla) u|_{L^{2}} \\
& \quad \leq \frac{1}{2}|-\Delta u|_{L^{2}}^{2}+\frac{1}{2}|(u \cdot \nabla) u|_{L^{2}}^{2} \leq \frac{1}{2}|u|_{\mathrm{D}(\mathrm{~A})}^{2}+\left.\frac{1}{2}| | u|\cdot| \nabla u\right|_{L^{2}} ^{2} .
\end{aligned}
$$

Let us introduce a function $\phi: \mathbb{R}_{+} \rightarrow \mathbb{R}$ such that $g(r)=r-\phi(r)$ which can be written as

$$
\phi(r)=\left\{\begin{array}{l}
r, \quad r \leq N \\
N, \quad r \geq N+1
\end{array}\right.
$$

Also $\phi^{\prime}(r)=1-g^{\prime}(r)$, and there exists a constant $\widetilde{C}_{N}>0^{3}$ such that $\left|\phi^{\prime}(r)\right| \leq$ $\widetilde{C}_{N}$ for every $r \geq 0$. Moreover

$$
\phi^{\prime}(r)= \begin{cases}1, & r \leq N \\ 0, & r \geq N+1\end{cases}
$$

Thus $\left|\phi^{\prime}(r) r\right|$ is bounded by some positive constant $C_{N}$. Let $u \in \mathrm{H}$, then using the definitions of $g$ and $((\cdot, \cdot))$ we get

$$
\begin{aligned}
& \left(\left(-g\left(|u|^{2}\right) u, u\right)\right)=-\left\langle g\left(|u|^{2}\right) u,-\Delta u\right\rangle_{L^{2}} \\
& =-\int_{\mathbb{R}^{3}} g\left(|u(x)|^{2}\right) u(x) \cdot(-\Delta u(x)) d x \\
& =-\int_{\mathbb{R}^{3}}|u(x)|^{2} u(x) \cdot(-\Delta u(x)) d x+\int_{\mathbb{R}^{3}} \phi\left(|u(x)|^{2}\right) u(x) \cdot(-\Delta u(x)) d x .
\end{aligned}
$$

Thus, by the integration by parts formula we get

$$
\begin{aligned}
\left(\left(-g\left(|u|^{2}\right) u, u\right)\right)= & -\int_{\mathbb{R}^{3}}|u(x)|^{2}|\nabla u(x)|^{2} d x-2 \int_{\mathbb{R}^{3}}|u(x)|^{2}|\nabla u(x)|^{2} d x \\
& +\sum_{j, k=1}^{3} \int_{\mathbb{R}^{3}} D_{k}\left(\phi\left(|u(x)|^{2}\right)\right) u_{j}(x) D_{k} u_{j}(x) d x
\end{aligned}
$$

[^2]\[

$$
\begin{equation*}
+\int_{\mathbb{R}^{3}} \phi\left(|u(x)|^{2}\right)|\nabla u(x)|^{2} d x \tag{2.22}
\end{equation*}
$$

\]

Using the above bound on $\left|\phi^{\prime}(r) r\right|$, we obtain

$$
\begin{align*}
& \sum_{j, k=1}^{3} \int_{\mathbb{R}^{3}} D_{k}\left(\phi\left(|u(x)|^{2}\right)\right) u_{j}(x) D_{k} u_{j}(x) d x \\
& \quad=2 \sum_{k=1}^{3} \int_{\mathbb{R}^{3}} \phi^{\prime}\left(|u(x)|^{2}\right)\left\langle u(x), D_{k} u(x)\right\rangle_{\mathbb{R}^{3}}^{2} d x \\
& \quad \leq 2 \int_{\mathbb{R}^{3}}\left|\phi^{\prime}\left(|u(x)|^{2}\right)\right||u(x)|^{2}|\nabla u(x)|^{2} d x \leq C_{N}|\nabla u|_{L^{2}}^{2} . \tag{2.23}
\end{align*}
$$

Since $g(r) \geq 0,|\phi(r)| \leq r$ for all $r \geq 0$. Thus using (2.23) in (2.22), we obtain

$$
\begin{aligned}
\left(\left(-g\left(|u|^{2}\right) u, u\right)\right) & \leq-3| | u|\cdot| \nabla u \|_{L^{2}}^{2}+C_{N}|\nabla u|_{L^{2}}^{2}+\left.||u| \cdot| \nabla u\right|_{L^{2}} ^{2} \\
& =C_{N}|\nabla u|_{L^{2}}^{2}-2| | u|\cdot| \nabla u| |_{L^{2}}^{2}
\end{aligned}
$$

Now to prove the second inequality in (2.19), we take the similar approach. Let $u \in \mathrm{H}$, then

$$
\left\langle-g\left(|u|^{2}\right) u, u\right\rangle_{L^{2}}=-\int_{\mathbb{R}^{3}}|u(x)|^{2}|u(x)|^{2} d x+\int_{\mathbb{R}^{3}} \phi\left(|u(x)|^{2}\right)|u(x)|^{2} d x
$$

By the definition of $\phi$ there exists a constant $C_{N}>0$ such that $|\phi(r)| \leq C_{N}$ for all $r>0$, thus

$$
\left\langle-g\left(|u|^{2}\right) u, u\right\rangle_{L^{2}} \leq-\|u\|_{L^{4}}^{4}+C_{N}|u|_{\mathrm{H}}^{2} .
$$

This completes the proof of part (ii).
Now for (iii), by (H1) and (H2) we have

$$
\begin{aligned}
& \|G(t, u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2}=\sum_{j=1}^{\infty}\left|G_{j}(t, u)\right|_{\mathrm{H}}^{2}=\sum_{j=1}^{\infty} \int_{\mathbb{R}^{3}}\left|G_{j}(t, x, u(t, x))\right|^{2} d x \\
& \quad \leq \int_{\mathbb{R}^{3}}\|\sigma(t, x)\|_{\ell^{2}}^{2}|\nabla u(t, x)|^{2} d x \leq\left(\sup _{x \in \mathbb{R}^{3}}\|\sigma(t, x)\|_{\ell^{2}}^{2}\right)|\nabla u(t)|_{L^{2}}^{2} \\
& \quad \leq \frac{1}{4}|\nabla u(t)|_{L^{2}}^{2} .
\end{aligned}
$$

Secondly, noting that

$$
\|G(t, u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{V}\right)}^{2}=\|G(t, u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2}+\|\nabla G(t, u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2}
$$

and

$$
\begin{aligned}
\partial_{x^{j}} G_{k}(t, u) & =\Pi \partial_{x^{j}}\left[\left(\sigma_{k}(t, x) \cdot \nabla\right) u(t)\right] \\
& =\Pi\left[\left(\partial_{x^{j}} \sigma_{k}(t, x) \cdot \nabla\right) u(t)+\left(\sigma_{k}(t, x) \cdot \nabla\right) \partial_{x^{j}} u(t)\right]
\end{aligned}
$$

by (H1) and (H2) we have

$$
\|G(t, u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{V}\right)}^{2} \leq \frac{1}{2}|\mathrm{~A} u(t)|_{L^{2}}^{2}+C_{T, \sigma}|\nabla u(t)|_{L^{2}}^{2} .
$$

On a purely heuristic level, by application of the Itô formula to the function $\mathrm{H} \ni \xi \mapsto|\xi|_{\mathrm{H}}^{2} \in \mathbb{R}$ and a solution $u$ to (1.1) and using Lemma 2.1, one obtains the following inequality

$$
\begin{align*}
& \frac{1}{2} d|u(t)|_{\mathrm{H}}^{2}=\left\langle u(t),-\mathrm{A} u(t)-B(u(t))-g\left(|u(t)|^{2}\right) u(t)+f(u(t))\right\rangle_{\mathrm{H}} \\
& \quad+\left\langle u(t), G(t, u(t)) d W_{t}\right\rangle_{\mathrm{H}}+\frac{1}{2}\left\|G\left(t, u_{n}(t)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2}  \tag{2.24}\\
& \quad \leq-\frac{7}{8}|\nabla u(t)|_{L^{2}}^{2}-\|u(t)\|_{L^{4}}^{4}+C_{N, f}|u(t)|_{\mathrm{H}}^{2}+\left\langle u(t), G(t, u(t)) d W_{t}\right\rangle_{\mathrm{H}}
\end{align*}
$$

which could lead to a'priori estimates that can be used further to prove the existence of the solution.

We will require the following version of the Gronwall Lemma [15, Lemma 3.9]:
Lemma 2.2. Let $X, Y, I$ and $\varphi$ be non-negative processes and $Z$ be a nonnegative integrable random variable. Assume that $I$ is non-decreasing and there exist non-negative constants $C, \alpha, \beta, \gamma, \eta$ with the following properties

$$
\begin{equation*}
\int_{0}^{T} \varphi(s) d s \leq C \text { a.s., } \quad 2 \beta e^{C} \leq 1, \quad 2 \eta e^{C} \leq \alpha \tag{2.25}
\end{equation*}
$$

and such that for some constant $\widetilde{C}>0$ and all $t \in[0, T]$,

$$
\begin{array}{r}
X(t)+\alpha Y(t) \leq Z+\int_{0}^{t} \varphi(r) X(r) d r+I(t) \quad \text { a.s. } \\
\mathbb{E}(I(t)) \leq \beta \mathbb{E}(X(t))+\gamma \int_{0}^{t} \mathbb{E}(X(s)) d s+\eta \mathbb{E}(Y(t))+\widetilde{C} \tag{2.27}
\end{array}
$$

If $X \in L^{\infty}([0, T] \times \Omega)$, then we have

$$
\begin{equation*}
\mathbb{E}[X(t)+\alpha Y(t)] \leq 2 \exp \left(C+2 t \gamma e^{C}\right)(\mathbb{E}(Z)+\widetilde{C}), \quad t \in[0, T] \tag{2.28}
\end{equation*}
$$

## 3. Compactness

Let $\left(\mathcal{O}_{R}\right)_{R \in \mathbb{N}}$ be a sequence of bounded open subsets of $\mathbb{R}^{3}$ with regular boundaries $\partial \mathcal{O}_{R}$ such that $\mathcal{O}_{R} \subset \mathcal{O}_{R+1}$. Let us consider the following functional spaces, which were already introduced in [8]:
$\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right):=$ the vector space of continuous functions $u:[0, T] \rightarrow \mathrm{U}^{\prime}$, where $\mathrm{U}^{\prime}$ is a vector space, with the topology $\mathcal{T}_{1}$ induced by the norm $|u|_{\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right)}:=$ $\sup _{t \in[0, T]}|u(t)|_{U^{\prime}}$,
$L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{A})):=$ is the Hilbert space $L^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ with the weak topology $\mathcal{T}_{2}$,
$L^{2}\left(0, T ; \mathrm{H}_{l o c}\right):=$ the space of measurable functions $u:[0, T] \rightarrow \mathrm{H}$ such that for all $R \in \mathbb{N}$

$$
\begin{equation*}
q_{T, R}(u):=\|u\|_{L^{2}\left(0, T ; H_{\mathcal{O}_{R}}\right)}=\left(\int_{0}^{T} \int_{\mathcal{O}_{R}}|u(t, x)|^{2} d x d t\right)^{1 / 2}<\infty \tag{3.1}
\end{equation*}
$$

with the topology $\mathcal{T}_{3}$ induced by the semi-norms $\left(q_{T, R}\right)_{R \in \mathbb{N}}$.

The following lemma is inspired by the classical Dubinsky theorem [39, Theorem IV.4.1] (see also [20]) and the compactness result due to Mikulevicus and Rozovskii [27, Lemma 2.7].
Lemma 3.1. Let

$$
\begin{equation*}
\widetilde{\mathcal{Z}}_{T}:=\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{~A})) \cap L^{2}\left(0, T ; \mathrm{H}_{l o c}\right) \tag{3.2}
\end{equation*}
$$

and let $\widetilde{\mathcal{T}}^{4}$ be the supremum of the corresponding topologies. Then a set $\mathcal{K} \subset$ $\widetilde{\mathcal{Z}}_{T}$ is $\widetilde{\mathcal{T}}$-relatively compact if the following two conditions hold :
(i) $\sup _{u \in \mathcal{K}} \int_{0}^{T}|u(s)|_{\mathrm{D}(\mathrm{A})}^{2} d s<\infty$, i.e. $\mathcal{K}$ is bounded in $L^{2}(0, T ; \mathrm{D}(\mathrm{A}))$,
(ii) $\lim _{\delta \rightarrow 0} \sup _{u \in \mathcal{K}} \sup _{\substack{s, t \in[0, T] \\|t-s| \leq \delta}}|u(t)-u(s)|_{\mathrm{U}^{\prime}}=0$.

The above lemma can be proved by modifying the proof of [8, Lemma 3.1], see also [39, Theorem IV.4.1].
Let $\mathrm{V}_{w}$ denote the Hilbert space V endowed with the weak topology.
$\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right):=$ the space of weakly continuous functions $u:[0, T] \rightarrow \mathrm{V}$ endowed with the weakest topology $\mathcal{T}_{4}$ such that for all $h \in \mathrm{~V}$ the mappings

$$
\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right) \ni u \rightarrow\langle u(\cdot), h\rangle_{\mathrm{V}} \in \mathcal{C}([0, T] ; \mathbb{R})
$$

are continuous. In particular, $u_{n} \rightarrow u$ in $\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$ iff for all $h \in \mathrm{~V}$ :

$$
\lim _{n \rightarrow \infty} \sup _{t \in[0, T]}\left|\left\langle u_{n}(t)-u(t), h\right\rangle_{\mathrm{V}}\right|=0 .
$$

Consider the ball

$$
\begin{equation*}
\mathbb{B}:=\left\{x \in \mathrm{~V}:\|x\|_{\mathrm{V}} \leq r\right\} \tag{3.3}
\end{equation*}
$$

Let $q$ be the metric compatible with the weak topology on $\mathbb{B}$. Let us recall the following subspace of the space $\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$

$$
\begin{align*}
\mathcal{C}\left([0, T] ; \mathbb{B}_{w}\right):= & \text { the space of weakly continuous functions } \\
& u:[0, T] \rightarrow \mathrm{V} \text { such that } \sup _{t \in[0, T]}\|u(t)\|_{\mathrm{V}} \leq r . \tag{3.4}
\end{align*}
$$

The space $\mathcal{C}\left([0, T] ; \mathbb{B}_{w}\right)$ is metrizable with metric

$$
\begin{equation*}
\varrho(u, \mathrm{v})=\sup _{t \in[0, T]} q(u(t), \mathrm{v}(t)) \tag{3.5}
\end{equation*}
$$

Since by the Banach-Alaoglu theorem $[34]$, the set $\mathbb{B}_{w}$ is compact, $\left(\mathcal{C}\left([0, T] ; \mathbb{B}_{w}\right), \varrho\right)$ is a complete metric space.

The following lemma says that any sequence $\left(u_{n}\right)_{n \in \mathbb{N}} \subset L^{\infty}([0, T] ; \mathbb{B})$, convergent in $\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right)$ is also convergent in the space $\mathcal{C}\left([0, T] ; \mathbb{B}_{w}\right)$. The proof of the lemma is similar to the proof of [9, Lemma 2.1] (see also [7, Lemma 4.1]).
Lemma 3.2. Let $r>0$ and $\left(u_{n}\right)_{n \in \mathbb{N}} \subset L^{\infty}(0, T ; \mathrm{V})$ be a sequence of functions such that
(i) $\sup _{n \in \mathbb{N}}\left\|u_{n}(s)\right\|_{L^{\infty}(0, T ; \mathrm{V})} \leq r$,

[^3](ii) $u_{n} \rightarrow u$ in $\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right)$.

Then $u, u_{n} \in \mathcal{C}\left([0, T] ; \mathbb{B}_{w}\right)$ and $u_{n} \rightarrow u$ in $\mathcal{C}\left([0, T] ; \mathbb{B}_{w}\right)$ as $n \rightarrow \infty$.
Proof. The lemma can be proved by following the steps of the proof of Lemma 4.1 [7] for our choice of functional spaces.

Let

$$
\begin{equation*}
\mathcal{Z}_{T}:=\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{~A})) \cap L^{2}\left(0, T ; \mathrm{H}_{l o c}\right) \cap \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right) \tag{3.6}
\end{equation*}
$$

and let $\mathcal{T}$ be the supremum of the corresponding topologies.
Now we formulate the compactness criterion analogous to the result due to Mikulevicus and Rozowskii [27], Brzeźniak and Motyl [8, Lemma 3.3] for the space $\mathcal{Z}_{T}$.

Lemma 3.3. Let $\left(\mathcal{Z}_{T}, \mathcal{T}\right)$ be as defined in (3.6). Then a set $\mathcal{K} \subset \mathcal{Z}_{T}$ is $\mathcal{T}$ relatively compact if the following three conditions hold
(a) $\sup _{u \in \mathcal{K}} \sup _{s \in[0, T]}\|u(s)\|_{\mathrm{V}}<\infty$,
(b) $\sup _{u \in \mathcal{K}} \int_{0}^{T}|u(s)|_{\mathrm{D}(\mathrm{A})}^{2} d s<\infty$, i.e. $\mathcal{K}$ is bounded in $L^{2}(0, T ; \mathrm{D}(\mathrm{A}))$,
(c) $\lim _{\delta \rightarrow 0} \sup _{u \in \mathcal{K}} \sup _{\substack{s, t \in[0, T] \\|t-s| \leq \delta}}|u(t)-u(s)|_{\mathrm{H}}=0$.

Proof. Let us denote $r=\sup _{u \in \mathcal{K}} \sup _{s \in[0, T]}\|u(s)\|_{\mathrm{V}}$, which in view of assumption $(c)$, is $<\infty$. Define the ball $\mathbb{B}$ of radius $r$ by (3.3).

Let us notice that $\mathcal{Z}_{T}=\widetilde{\mathcal{Z}}_{T} \cap \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$, where $\widetilde{\mathcal{Z}}_{T}$ is defined by (3.2). Let $\mathcal{K}$ be a subset of $\mathcal{Z}_{T}$. Because of the assumption (a) we may consider the metric space $\mathcal{C}\left([0, T] ; \mathbb{B}_{w}\right) \subset \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$ defined by (3.4) and (3.5). Because of the assumption (b), the restriction to $\mathcal{K}$ of the weak topology in $L^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ is metrizable. Since the restrictions to $\mathcal{K}$ of the four topologies considered in $\mathcal{Z}_{T}$ are metrizable, compactness of a subset of $\mathcal{Z}_{T}$ is equivalent to its sequential compactness.

Let $\left(u_{n}\right)$ be a sequence in $\mathcal{K}$. By Lemma 3.1, the boundedness of the set $\mathcal{K}$ in $L^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ and assumption (c) imply that $\mathcal{K}$ is compact in $\widetilde{\mathcal{Z}}_{T}$. Hence in particular, there exists a subsequence, still denoted by $\left(u_{n}\right)$, convergent in $\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right)$. Therefore by Lemma 3.2 and assumption $(a),\left(u_{n}\right)$ is convergent in $\mathcal{C}\left([0, T] ; \mathbb{B}_{w}\right)$. This completes the proof of the lemma.

### 3.1. Tightness

Let $(\mathbb{S}, \varrho)$ be a separable and complete metric space.
Definition 3.4. Let $u \in \mathcal{C}([0, T] ; \mathbb{S})$. The modulus of continuity of $u$ on $[0, T]$ is defined by

$$
m(u, \delta):=\sup _{s, t \in[0, T],|t-s| \leq \delta} \varrho(u(t), u(s)), \quad \delta>0
$$

Let $(\Omega, \mathcal{F}, \mathbb{P})$ be a probability space with filtration $\mathbb{F}:=\left(\mathcal{F}_{t}\right)_{t \in[0, T]}$ satisfying the usual conditions, see [24], and let $\left(X_{n}\right)_{n \in \mathbb{N}}$ be a sequence of continuous $\mathbb{F}$-adapted $\mathbb{S}$-valued processes.

Definition 3.5. We say that the sequence $\left(X_{n}\right)_{n \in \mathbb{N}}$ of $\mathcal{C}([0, T] ; \mathbb{S})$-valued random variables satisfies condition $[\mathbf{T}]$ iff $\forall \varepsilon>0, \forall \eta>0, \exists \delta>0$ :

$$
\begin{equation*}
\sup _{n \in \mathbb{N}} \mathbb{P}\left\{m\left(X_{n}, \delta\right)>\eta\right\} \leq \varepsilon \tag{3.7}
\end{equation*}
$$

Lemma 3.6. (See $\left[9\right.$, Lemma 2.4]) Assume that $\left(X_{n}\right)_{n \in \mathbb{N}}$ satisfies condition $[\mathbf{T}]$. Let $\mathbb{P}_{n}$ be the law of $X_{n}$ on $\mathcal{C}([0, T] ; \mathbb{S}), n \in \mathbb{N}$. Then for every $\varepsilon>0$ there exists a subset $A_{\varepsilon} \subset \mathcal{C}([0, T] ; \mathbb{S})$ such that

$$
\sup _{n \in \mathbb{N}} \mathbb{P}_{n}\left(A_{\varepsilon}\right) \geq 1-\varepsilon
$$

and

$$
\begin{equation*}
\lim _{\delta \rightarrow 0} \sup _{u \in A_{\varepsilon}} m(u, \delta)=0 \tag{3.8}
\end{equation*}
$$

Now we recall the Aldous condition which is connected with condition [T] (see [25] and [2]). This condition allows to investigate the modulus of continuity for the sequence of stochastic processes by means of stopped processes.

Definition 3.7. A sequence $\left(X_{n}\right)_{n \in \mathbb{N}}$ satisfies condition $[\mathbf{A}]$ iff $\forall \varepsilon>0, \forall \eta>0$, $\exists \delta>0$ such that for every sequence $\left(\tau_{n}\right)_{n \in \mathbb{N}}$ of $\mathbb{F}$-stopping times with $\tau_{n} \leq T$ one has

$$
\sup _{n \in \mathbb{N}} \sup _{0 \leq \theta \leq \delta} \mathbb{P}\left\{\varrho\left(X_{n}\left(\tau_{n}+\theta\right), X_{n}\left(\tau_{n}\right)\right) \geq \eta\right\} \leq \varepsilon
$$

Lemma 3.8. (See [25, Theorem 3.2]) Conditions [A] and $[\mathbf{T}]$ are equivalent.
Using the compactness criterion from Lemma 3.3 and above results corresponding to Aldous condition we obtain the following corollary which we will use to prove the tightness of the laws defined by the truncated SPDE (4.25).

Corollary 3.9 (Tightness criterion). Let $\left(X_{n}\right)_{n \in \mathbb{N}}$ be a sequence of $\mathbb{F}$-adapted continuous H -valued processes such that
(a) there exists a constant $C_{1}>0$ such that

$$
\sup _{n \in \mathbb{N}} \mathbb{E}\left[\sup _{s \in[0, T]}\left\|X_{n}(s)\right\|_{\mathrm{V}}^{2}\right] \leq C_{1}
$$

(b) there exists a constant $C_{2}>0$ such that

$$
\sup _{n \in \mathbb{N}} \mathbb{E}\left[\int_{0}^{T}\left|X_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right] \leq C_{2}
$$

(c) $\left(X_{n}\right)_{n \in \mathbb{N}}$ satisfies the Aldous condition $[\mathbf{A}]$ in H .

Let $\mathbb{P}_{n}$ be the law of $X_{n}$ on $\mathcal{Z}_{T}$. Then for every $\varepsilon>0$ there exists a compact subset $K_{\varepsilon}$ of $\mathcal{Z}_{T}$ such that

$$
\sup _{n \in \mathbb{N}} \mathbb{P}_{n}\left(K_{\varepsilon}\right) \geq 1-\varepsilon
$$

Proof. Let $\varepsilon>0$. By the Chebyshev inequality and (a), we infer that for any $n \in \mathbb{N}$ and any $r>0$

$$
\mathbb{P}\left(\left\{X_{n} \in \mathcal{Z}_{T}: \sup _{s \in[0, T]}\left\|X_{n}(s)\right\|_{\mathrm{V}}^{2}>r\right\}\right) \leq \frac{\mathbb{E}\left[\sup _{s \in[0, T]}\left\|X_{n}(s)\right\|_{\mathrm{V}}^{2}\right]}{r} \leq \frac{C_{1}}{r}
$$

Let $R_{1}$ be such that $\frac{C_{1}}{R_{1}} \leq \frac{\varepsilon}{3}$. Then

$$
\sup _{n \in \mathbb{N}} \mathbb{P}_{n}\left(\left\{\sup _{s \in[0, T]}\left\|X_{n}(s)\right\|_{\mathrm{V}}^{2}>R_{1}\right\}\right) \leq \frac{\varepsilon}{3} .
$$

Let $B_{1}:=\left\{X_{n} \in \mathcal{Z}_{T}: \sup _{s \in[0, T]}\left\|X_{n}(s)\right\|_{\mathrm{V}}^{2} \leq R_{1}\right\}$.
By the Chebyshev inequality and (b), we infer that for any $n \in \mathbb{N}$ and any $r>0$

$$
\mathbb{P}\left(\left\{X_{n} \in \mathcal{Z}_{T}:\left\|X_{n}\right\|_{L^{2}(0, T ; \mathrm{D}(\mathrm{~A}))}>r\right\}\right) \leq \frac{\mathbb{E}\left[\left\|X_{n}\right\|_{L^{2}(0, T ; \mathrm{D}(\mathrm{~A}))}^{2}\right]}{r^{2}} \leq \frac{C_{2}}{r^{2}}
$$

Let $R_{2}$ be such that $\frac{C_{2}}{R_{2}^{2}} \leq \frac{\varepsilon}{3}$. Then

$$
\sup _{n \in \mathbb{N}} \mathbb{P}_{n}\left(\left\{\left\|X_{n}\right\|_{L^{2}(0, T ; \mathrm{D}(\mathrm{~A}))}>R_{2}\right\}\right) \leq \frac{\varepsilon}{3}
$$

Let $B_{2}:=\left\{X_{n} \in \mathcal{Z}_{T}:\left\|X_{n}\right\|_{L^{2}(0, T ; \mathrm{D}(\mathrm{A}))} \leq R_{2}\right\}$.
By Lemmas 3.6 and 3.8 there exists a subset $A_{\frac{\varepsilon}{3}} \subset \mathcal{C}([0, T], \mathrm{H})$ such that $\mathbb{P}_{n}\left(A_{\frac{\varepsilon}{3}}\right) \geq 1-\frac{\varepsilon}{3}$ and

$$
\lim _{\delta \rightarrow 0} \sup _{u \in A_{\frac{\varepsilon}{3}}} \sup _{\substack{s, t \in[0, T] \\|t-s| \leq \delta}}|u(t)-u(s)|_{\mathrm{H}}=0 .
$$

It is sufficient to define $K_{\varepsilon}$ as the closure of the set $B_{1} \cap B_{2} \cap A_{\frac{\varepsilon}{3}}$ in $\mathcal{Z}_{T}$. By Lemma 3.3, $K_{\varepsilon}$ is compact in $\mathcal{Z}_{T}$. The proof is thus complete.

### 3.2. The Skorohod theorem

We will use the following Jakubowski's generalisation of the Skorohod theorem in the form given by Brzeźniak and Ondreját [11], see also [17].

Theorem 3.10. Let $\mathcal{X}$ be a topological space such that there exists a sequence $\left\{f_{m}\right\}_{m \in \mathbb{N}}$ of continuous functions $f_{m}: \mathcal{X} \rightarrow \mathbb{R}$ that separates points of $\mathcal{X}$. Let us denote by $\mathcal{S}$ the $\sigma$-algebra generated by the maps $\left\{f_{m}\right\}$. Then
(a) every compact subset of $\mathcal{X}$ is metrizable,
(b) if $\left(\mu_{m}\right)_{m \in \mathbb{N}}$ is a tight sequence of probability measures on $(\mathcal{X}, \mathcal{S})$, then there exists a subsequence $\left(m_{k}\right)_{k \in \mathbb{N}}$, a probability space $(\Omega, \mathcal{F}, \mathbb{P})$ with $\mathcal{X}$ valued Borel measurable variables $\xi_{k}, \xi$ such that $\mu_{m_{k}}$ is the law of $\xi_{k}$ and $\xi_{k}$ converges to $\xi$ almost surely on $\Omega$. Moreover, the law of $\xi$ is a Radon measure.

Using Theorem 3.10, we obtain the following corollary which we will apply to construct a martingale solution of the stochastic tamed NavierStokes equations.

Corollary 3.11. Let $\left(\eta_{n}\right)_{n \in \mathbb{N}}$ be a sequence of $\mathcal{Z}_{T}$-valued random variables such that their laws $\operatorname{law}\left(\eta_{n}\right)$ on $\left(\mathcal{Z}_{T}, \mathcal{T}\right)$ form a tight sequence of probability measures. Then there exists a subsequence $\left(n_{k}\right)$, a probability space $(\widetilde{\Omega}, \widetilde{\mathcal{F}}, \widetilde{\mathbb{P}})$ and $\mathcal{Z}_{T}$-valued random variables $\widetilde{\eta}, \widetilde{\eta}_{k}, k \in \mathbb{N}$ such that the variables $\eta_{k}$ and $\widetilde{\eta}_{k}$ have the same laws on $\mathcal{Z}_{T}$ and $\widetilde{\eta}_{k}$ converges to $\widetilde{\eta}$ almost surely on $\widetilde{\Omega}$.

Proof. It is sufficient to prove that on each space appearing in the definition (3.6) of the space $\mathcal{Z}_{T}$, there exists a countable set of continuous real-valued functions separating points.

Since the spaces $\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right)$ and $L^{2}\left(0, T ; \mathrm{H}_{l o c}\right)$ are separable, metrizable and complete, this condition is satisfied, see [3], exposé 8.

For the space $L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ it is sufficient to put

$$
f_{m}(u):=\int_{0}^{T}\left\langle u(t), \mathrm{v}_{m}(t)\right\rangle_{\mathrm{D}(\mathrm{~A})} d t \in \mathbb{R}, \quad u \in L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{~A})), \quad m \in \mathbb{N},
$$

where $\left\{\mathrm{v}_{m}, m \in \mathbb{N}\right\}$ is a dense subset of $L^{2}(0, T ; \mathrm{D}(\mathrm{A}))$.
Let us consider the space $\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$. Let $\left\{h_{m}, m \in \mathbb{N}\right\}$ be any dense subset of V and let $\mathbb{Q}_{T}$ be the set of rational numbers belonging to the interval $[0, T]$. Then the family $\left\{f_{m, t}, m \in \mathbb{N}, t \in \mathbb{Q}_{T}\right\}$ defined by

$$
f_{m, t}(u):=\left\langle u(t), h_{m}\right\rangle_{\mathrm{V}} \in \mathbb{R}, \quad u \in \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right), \quad m \in \mathbb{N}, \quad t \in \mathbb{Q}_{T}
$$

consists of continuous functions separating points in $\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$. The statement of the corollary follows from Theorem 3.10, concluding the proof.

We end this section by giving the definitions of a martingale and strong solution to (2.17).

Definition 3.12. A stochastic basis $(\Omega, \mathcal{F}, \mathbb{F}, \mathbb{P})$ is a probability space equipped with the filtration $\mathbb{F}=\left\{\mathcal{F}_{t}\right\}_{t \geq 0}$ of its $\sigma$-field $\mathcal{F}$.

Definition 3.13. A martingale solution of (2.17) is a system

$$
(\widehat{\Omega}, \widehat{\mathcal{F}}, \widehat{\mathbb{F}}, \widehat{\mathbb{P}}, \widehat{W}, \widehat{u})
$$

where $(\widehat{\Omega}, \widehat{\mathcal{F}}, \widehat{\mathbb{P}})$ is a probability space and $\widehat{\mathbb{F}}=\left(\widehat{\mathcal{F}}_{t}\right)_{t \geq 0}$ is a filtration on it, such that

- $\widehat{W}$ is an $\ell^{2}$-valued cylindrical Wiener process on $(\widehat{\Omega}, \widehat{\mathcal{F}}, \widehat{\mathbb{F}}, \widehat{\mathbb{P}})$,
- $\widehat{u}$ is $\mathrm{D}(\mathrm{A})$-valued progressively measurable process, V -valued weakly continuous $\widehat{\mathbb{F}}$-adapted process such that

$$
\begin{gathered}
\widehat{u}(\cdot, \omega) \in \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right) \cap L^{2}(0, T ; \mathrm{D}(\mathrm{~A})), \\
\widehat{\mathbb{E}}\left(\sup _{t \in[0, T]}\|\widehat{u}(t)\|_{\mathrm{V}}^{2}+\int_{0}^{T}|\widehat{u}(t)|_{\mathrm{D}(\mathrm{~A})}^{2} d t\right)<\infty
\end{gathered}
$$

and

$$
\begin{align*}
& \langle\widehat{u}(t), \mathrm{v}\rangle+\int_{0}^{t}\langle\mathrm{~A} \widehat{u}(s), \mathrm{v}\rangle d s+\int_{0}^{t}\langle B(\widehat{u}(s)), \mathrm{v}\rangle d s \\
& +\int_{0}^{t}\left\langle g\left(|\widehat{u}(s)|^{2}\right) \widehat{u}(s), \mathrm{v}\right\rangle d s=\left\langle u_{0}, \mathrm{v}\right\rangle+\int_{0}^{t}\langle f(\widehat{u}(s)), \mathrm{v}\rangle d s  \tag{3.9}\\
& \quad+\left\langle\int_{0}^{t} G(s, \widehat{u}(s)) d W(s), \mathrm{v}\right\rangle .
\end{align*}
$$

for all $t \in[0, T]$ and all $\mathrm{v} \in \mathcal{V}, \widehat{\mathbb{P}}$-a.s.
Definition 3.14. We say that problem (2.17) has a strong solution if for every stochastic basis $(\Omega, \mathcal{F}, \mathbb{F}, \mathbb{P})$ and $\ell^{2}$-valued cylindrical Wiener process $W(t)$ on the given filtered probability space there exists a $\mathrm{D}(\mathrm{A})$-valued progressively measurable process,V-valued continuous $\mathbb{F}$-adapted process $u$ such that

$$
u(\cdot, \omega) \in \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right) \cap L^{2}(0, T ; \mathrm{D}(\mathrm{~A})),
$$

and satisfies (3.9) for all $t \in[0, T]$ and all $\mathrm{v} \in \mathcal{V}$, $\mathbb{P}$-a.s.
Remark 3.15. The strong solution defined in Definition 3.14 is a probabilistically strong solution with the same regularity as a martingale solution. But, in Theorem 5.19 we show that the strong solution $u$ is more regular, i.e. $u \in \mathcal{C}([0, T] ; \mathrm{V}) \cap L^{2}(0, T ; \mathrm{D}(\mathrm{A}))$.

## 4. Truncated SPDEs

The approximation scheme described in this section to define truncated SPDEs was first introduced by [16] and also later used by Manna et al. in [21].

In order to describe the approximation scheme, we will use the following notations and spaces.

$$
B_{n}:=\left\{\xi \in \mathbb{R}^{3}:|\xi| \leq n\right\} \subset \mathbb{R}^{3}, \quad n \in \mathbb{N}
$$

where $|\cdot|$ is the Euclidean norm on $\mathbb{R}^{3}$. We will use $\mathcal{F}(u)$ and $\hat{u}$ interchangeably to denote the Fourier transform of $u$. The inverse Fourier transform will be given by $\mathcal{F}^{-1}$.

We define $\mathrm{H}_{n}$ as the subspace of H ,

$$
\mathrm{H}_{n}:=\left\{u \in \mathrm{H}: \operatorname{supp}(\hat{\mathrm{u}}) \subset \mathrm{B}_{\mathrm{n}}\right\} .
$$

The norm on $\mathrm{H}_{n}$ is inherited from H . For $n \in \mathbb{N}$, let us define a map $P_{n}$ by

$$
\begin{equation*}
P_{n} u:=\mathcal{F}^{-1}\left(\mathbb{1}_{B_{n}} \hat{u}\right) . \tag{4.1}
\end{equation*}
$$

Firstly, note that $P_{n}: \mathrm{H} \rightarrow \mathrm{H}$ is a linear and bounded map. Moreover, Range $\left(P_{n}\right) \subset H_{n}$ and hence one can deduce that

$$
P_{n}: \mathrm{H} \rightarrow \mathrm{H}_{n} .
$$

In addition, $P_{n}$ is an orthogonal projection onto $\mathrm{H}_{n}$ i.e. $\forall u \in \mathrm{H}, u-P_{n} u \perp$ $\mathrm{H}_{n}$. In other words

$$
\left\langle u-P_{n} u, \mathrm{v}\right\rangle_{H}=0, \quad \forall \mathrm{v} \in \mathrm{H}_{n}
$$

Indeed, for $u \in \mathrm{H}$ and $\mathrm{v} \in \mathrm{H}_{n}$, we have

$$
\begin{aligned}
\left\langle P_{n} u, \mathrm{v}\right\rangle_{H} & =\left\langle P_{n} u, \mathrm{v}\right\rangle_{L^{2}}=\left\langle\mathcal{F}^{-1}\left(\mathbb{1}_{B_{n}} \hat{u}\right), \mathcal{F}^{-1}(\hat{\mathrm{v}})\right\rangle_{L^{2}} \\
& =\left\langle\mathbb{1}_{B_{n}} \hat{u}, \hat{\mathrm{v}}\right\rangle_{L^{2}}=\int_{|\xi| \leq n} \hat{u}(\xi) \cdot \hat{\mathrm{v}}(\xi) d \xi=\int_{\mathbb{R}^{3}} \hat{u}(\xi) \cdot \hat{\mathrm{v}}(\xi) d \xi \\
& =\langle\hat{u}, \hat{\mathrm{v}}\rangle_{L^{2}}=\langle u, \mathrm{v}\rangle_{\mathrm{H}}
\end{aligned}
$$

Let us recall that $\mathrm{D}(\mathrm{A}):=\mathrm{H} \cap \mathrm{H}^{2,2}$ and the Stokes operator is given by

$$
\mathrm{A} u=-\Pi(\Delta u), \quad u \in \mathrm{D}(\mathrm{~A})
$$

and $\mathrm{D}(\mathrm{A})$ is a Hilbert space under the graph norm

$$
|u|_{\mathrm{D}(\mathrm{~A})}^{2}:=|u|_{\mathrm{H}}^{2}+|\mathrm{A} u|_{\mathrm{H}}^{2} .
$$

Lemma 4.1. Let $P_{n}$ be the orthogonal projection given by (4.1), then $P_{n}$ : $\mathrm{V} \rightarrow \mathrm{V}$ is uniformly bounded.

Proof. Let $u \in \mathrm{~V}$, then by the definition of $P_{n}$ and V

$$
\begin{aligned}
& \left\|P_{n} u\right\|_{\mathrm{V}}=\left[\int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)\left|\mathcal{F}\left(P_{n} u\right)(\xi)\right|^{2} d \xi\right]^{1 / 2} \\
& \quad=\left[\int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)\left|\mathbb{1}_{B_{n}}(\xi) \hat{u}(\xi)\right|^{2} d \xi\right]^{1 / 2}=\left[\int_{|\xi| \leq n}\left(1+|\xi|^{2}\right)|\hat{u}(\xi)|^{2} d \xi\right]^{1 / 2} \\
& \quad \leq\left[\int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)|\hat{u}(\xi)|^{2} d \xi\right]^{1 / 2}=\|u\|_{\mathrm{V}}
\end{aligned}
$$

Thus we have shown that

$$
\left\|P_{n} u\right\|_{\mathrm{V}} \leq\|u\|_{\mathrm{V}}
$$

and hence $P_{n}$ is uniformly bounded in V .
Lemma 4.2. If $u \in \mathrm{D}(\mathrm{A})$ then $\Delta u \in \mathrm{H}$. In particular, if $u \in \mathrm{D}(\mathrm{A})$ then A $u=-\Delta u$.

Proof. Since $u \in \mathrm{D}(\mathrm{A})$, it is clear that $\Delta u \in L^{2}$. Thus we are left to show that $\operatorname{div}(\Delta u)=0$ in the weak sense. Let $\varphi \in C_{0}^{\infty}\left(\mathbb{R}^{3}\right)$, then using the definition of div and $\Delta$, we get

$$
\langle\operatorname{div}(\Delta \mathrm{u}) \mid \varphi\rangle=-\langle\Delta u \mid \nabla \varphi\rangle=-\langle u \mid \Delta(\nabla \varphi)\rangle=\langle\operatorname{div} \mathrm{u} \mid \Delta \varphi\rangle=0
$$

By definition $\mathrm{A} u=-\Pi(\Delta u)$, but since $\Delta u \in \mathrm{H}$, and $\Pi: L^{2} \rightarrow \mathrm{H}$ is an orthogonal projection, $\Pi(\Delta u)=\Delta u$ and hence,

$$
\begin{equation*}
\mathrm{A} u=-\Delta u, \quad u \in \mathrm{D}(\mathrm{~A}) \tag{4.2}
\end{equation*}
$$

Lemma 4.3. If $n \in \mathbb{N}$, then $H_{n} \subset \mathrm{D}(\mathrm{A})$ and

$$
\begin{equation*}
P_{n}(\mathrm{~A} u)=\mathrm{A} u, \quad u \in \mathrm{H}_{n} . \tag{4.3}
\end{equation*}
$$

Proof. We start with proving the first statement. Let $u \in \mathrm{H}_{n}$; by definition

$$
\mathrm{D}(\mathrm{~A})=\left\{\mathrm{u} \in \mathrm{H}: \mathrm{u} \in \mathrm{H}^{2,2}\right\}=\left\{\mathrm{u} \in \mathrm{H}: \int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)^{2}|\hat{\mathrm{u}}(\xi)|^{2} \mathrm{~d} \xi<\infty\right\} .
$$

Since $u \in \mathrm{H}_{n}, \operatorname{supp}(\hat{\mathrm{u}}) \subset \mathrm{B}_{\mathrm{n}}$,

$$
\begin{aligned}
& \int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)^{2}|\hat{u}(\xi)|^{2} d \xi=\int_{|\xi| \leq n}\left(1+|\xi|^{2}\right)^{2}|\hat{u}(\xi)|^{2} d \xi \\
& \quad \leq\left(1+n^{2}\right)^{2} \int_{|\xi| \leq n}|\hat{u}(\xi)|^{2} d \xi=\left(1+n^{2}\right)^{2} \int_{\mathbb{R}^{3}}|\hat{u}(\xi)|^{2} d \xi \\
& \quad=\left(1+n^{2}\right)^{2}\|u\|_{H_{n}}^{2}<\infty
\end{aligned}
$$

Thus we have proved that $u \in \mathrm{D}(\mathrm{A})$ and hence $\mathrm{H}_{n} \subset \mathrm{D}(\mathrm{A})$. Moreover, we showed that there exists a constant $C_{n}>0$, depending on $n$ such that

$$
\begin{equation*}
|u|_{\mathrm{D}(\mathrm{~A})} \leq C_{n}\|u\|_{\mathrm{H}_{n}}, \quad u \in \mathrm{H}_{n} . \tag{4.4}
\end{equation*}
$$

Now in order to establish the equality (4.3), we just need to show that $\mathrm{A} u \in$ $\mathrm{H}_{\mathrm{n}}$. Since $u \in \mathrm{H}_{\mathrm{n}}, u \in \mathrm{D}(\mathrm{A})$. Hence from Lemma 4.1, $\mathrm{A} u=-\Delta u$. We are left to show that $\operatorname{supp}(\mathcal{F}(\mathrm{Au})) \subset \mathrm{B}_{\mathrm{n}}$. Using the definition of $\mathrm{A} u$, we get following equalities

$$
\mathcal{F}(\mathrm{A} u)(\xi)=-\mathcal{F}(\Delta u)(\xi)=-|\xi|^{2} \hat{u}(\xi) .
$$

Thus

$$
\operatorname{supp}(\mathcal{F}(\mathrm{A} u)) \subset \operatorname{supp}\left(|\cdot|^{2}\right) \cap \operatorname{supp}(\hat{u}) \subset B_{n}
$$

Hence $\mathrm{A} u \in \mathrm{H}_{\mathrm{n}}$. Since $P_{n}: \mathrm{H} \rightarrow \mathrm{H}_{n}$ is an orthogonal projection, we infer that

$$
P_{n}(\mathrm{~A} u)=\mathrm{A} u .
$$

Lemma 4.4. If $n \in \mathbb{N}$, then the map $\mathrm{A}_{n}:=\left.\mathrm{A}\right|_{H_{n}}: H_{n} \rightarrow H_{n}$, is linear and bounded.

Proof. In Lemma 4.2 we showed that $\mathrm{A}_{n}$ is well defined and it's straightforward to show it is linear. We are left to show that it is bounded. Let $u \in \mathrm{H}_{\mathrm{n}}$, then by Parseval equality and the definition of $\mathrm{H}_{n}$

$$
\begin{aligned}
\left\|\mathrm{A}_{n} u\right\|_{\mathrm{H}_{\mathrm{n}}} & =|-\Delta u|_{L^{2}}=\left[\int_{\mathbb{R}^{3}}|\xi|^{2}|\hat{u}(\xi)|^{2} d \xi\right]^{1 / 2} \\
& =\left[\int_{|\xi| \leq n}|\xi|^{2}|\hat{u}(\xi)|^{2} d \xi\right]^{1 / 2} \leq\left[n^{2} \int_{|\xi| \leq n}|\hat{u}(\xi)|^{2} d \xi\right]^{1 / 2} \\
& =\left[n^{2} \int_{\mathbb{R}^{3}}|\hat{u}(\xi)|^{2} d \xi\right]^{1 / 2}=n\|u\|_{H_{n}}
\end{aligned}
$$

Thus,

$$
\begin{equation*}
\left\|\mathrm{A}_{n} u\right\|_{\mathrm{H}_{n}} \leq n\|u\|_{\mathrm{H}_{\mathrm{n}}} . \tag{4.5}
\end{equation*}
$$

Lemma 4.5. If $n \in \mathbb{N}$, then the map

$$
\begin{equation*}
B_{n}: \mathrm{H}_{n} \times \mathrm{H}_{n} \ni(u, \mathrm{v}) \mapsto P_{n}(B(u, \mathrm{v})) \in \mathrm{H}_{n} \tag{4.6}
\end{equation*}
$$

is well defined and Lipschitz on a ball $\mathbb{B}_{R}:=\left\{u \in \mathrm{H}_{n}:\|u\|_{\mathrm{H}_{n}} \leq R\right\}, R>0$. Moreover

$$
\begin{align*}
\left\langle B_{n}(u), u\right\rangle_{\mathrm{H}} & =0, \quad u \in \mathrm{H}_{n}  \tag{4.7}\\
\left|\left(\left(B_{n}(u), u\right)\right)\right| & \leq \frac{1}{2}|u|_{\mathrm{D}(\mathrm{~A})}^{2}+\left.\frac{1}{2}| | u|\cdot| \nabla u\right|_{L^{2}} ^{2}, \quad u \in \mathrm{H}_{n}, \tag{4.8}
\end{align*}
$$

where $B_{n}(u):=B_{n}(u, u)$ and $((\cdot, \cdot))$ is defined in (2.1).
Proof. We will show that $\forall u, \mathrm{v} \in \mathrm{H}_{n}, B(u, \mathrm{v}) \in \mathrm{H}$. Since $u, \mathrm{v} \in \mathrm{H}_{\mathrm{n}}, u, \mathrm{v} \in$ $\mathrm{D}(\mathrm{A})$. Thus,

$$
|B(u, \mathrm{v})|_{\mathrm{H}}=|\Pi(u \cdot \nabla \mathrm{v})|_{\mathrm{H}} \leq|u \cdot \nabla \mathrm{v}|_{L^{2}} \leq\|u\|_{L^{\infty}}|\nabla \mathrm{v}|_{L^{2}} .
$$

Since $H^{s, 2}\left(\mathbb{R}^{d}\right) \hookrightarrow L^{\infty}\left(\mathbb{R}^{d}\right)$ for every $s>\frac{d}{2}$, there exists a constant $C>0$ such that

$$
\|u\|_{L^{\infty}\left(\mathbb{R}^{3}\right)} \leq C\|u\|_{H^{s, 2}\left(\mathbb{R}^{3}\right)}, \quad \text { for } s>\frac{3}{2}
$$

In particular, it holds true for $s=2$. Thus, we have

$$
|B(u, \mathrm{v})|_{\mathrm{H}} \leq C\|u\|_{H^{2}}\|\mathrm{v}\|_{H^{1}}
$$

Now by (4.4) and (4.14)

$$
\begin{equation*}
|B(u, \mathrm{v})|_{\mathrm{H}} \leq K_{n}\|u\|_{\mathrm{H}_{n}}\|\mathrm{v}\|_{\mathrm{H}_{n}}<\infty . \tag{4.9}
\end{equation*}
$$

Hence $B(u, \mathrm{v}) \in \mathrm{H}$, which implies $B_{n}(u, \mathrm{v}) \in \mathrm{H}_{n}$ and is well defined.
Let $R>0$ be fixed and $u, \mathrm{v} \in \mathbb{B}_{R}$. Then, as before, using the embedding $H^{2} \hookrightarrow L^{\infty}$, we have

$$
\begin{aligned}
& \left\|B_{n}(u)-B_{n}(\mathrm{v})\right\|_{\mathrm{H}_{n}} \leq|B(u)-B(\mathrm{v})|_{\mathrm{H}} \leq|u \cdot \nabla u-\mathrm{v} \cdot \nabla \mathrm{v}|_{L^{2}} \\
& \quad \leq\|u-\mathrm{v}\|_{L^{\infty}}|\nabla u|_{L^{2}}+\|\mathrm{v}\|_{L^{\infty}}|\nabla(u-\mathrm{v})|_{L^{2}} \\
& \quad \leq\|u-\mathrm{v}\|_{H^{2}}\|u\|_{H^{1}}+\|\mathrm{v}\|_{H^{2}}\|u-\mathrm{v}\|_{H^{1}} .
\end{aligned}
$$

Since $u, v \in \mathbb{B}_{R}$, and using (4.4) and (4.14), we get

$$
\begin{equation*}
\left\|B_{n}(u)-B_{n}(\mathrm{v})\right\|_{\mathrm{H}_{n}} \leq C_{n, R}\|u-\mathrm{v}\|_{\mathrm{H}_{n}}, \quad u, \mathrm{v} \in \mathbb{B}_{R} \tag{4.10}
\end{equation*}
$$

Since $u \in \mathrm{H}_{n}$ and $P_{n}$ is the orthogonal projection on $H$,

$$
\left\langle B_{n}(u), u\right\rangle_{\mathrm{H}}=\left\langle P_{n}(B(u, u)), u\right\rangle_{\mathrm{H}}=\left\langle B(u, u), P_{n} u\right\rangle_{\mathrm{H}}=\langle B(u, u), u\rangle_{\mathrm{H}}=0
$$

Also by using the definition of $((\cdot, \cdot))$ and the Cauchy-Schwarz inequality we get

$$
\begin{aligned}
\left|\left(\left(B_{n}(u), u\right)\right)\right| & =\left|\left\langle B_{n}(u),-\Delta u\right\rangle_{\mathrm{H}}\right|=\left|\left\langle B(u, u),-P_{n}(\Delta u)\right\rangle_{\mathrm{H}}\right| \\
& =\left|\langle B(u, u),-\Delta u\rangle_{\mathrm{H}}\right| \leq|B(u, u)|_{\mathrm{H}}|(-\Delta u)|_{\mathrm{H}} \\
& \leq \frac{1}{2}|u|_{\mathrm{D}(\mathrm{~A})}^{2}+\left.\frac{1}{2}| | u|\cdot| \nabla u\right|_{L^{2}} ^{2} .
\end{aligned}
$$

Lemma 4.6. The map

$$
\begin{equation*}
g_{n}: \mathrm{H}_{n} \ni u \mapsto P_{n}\left[\Pi\left(g\left(|u|^{2}\right) u\right)\right] \in \mathrm{H}_{n} \tag{4.11}
\end{equation*}
$$

is well defined and Lipschitz on a ball $\mathbb{B}_{R}, R>0$. Moreover

$$
\begin{cases}\left(\left(-g_{n}(u), u\right)\right) \leq C_{N}|\nabla u|_{L^{2}}^{2}-2| | u|\cdot| \nabla u \|_{L^{2}}^{2}, & u \in \mathrm{H}_{n},  \tag{4.12}\\ \left\langle-g_{n}(u), u\right\rangle_{\mathrm{H}} \leq-\|u\|_{L^{4}}^{4}+C_{N}|u|_{\mathrm{H}}^{2}, & u \in \mathrm{H}_{n},\end{cases}
$$

Proof. Let $u \in \mathrm{H}_{n}$, then by the definition of $g$ (2.14), the estimate (2.15) and the embedding of $H^{1} \hookrightarrow L^{6}$, we have

$$
\begin{align*}
& \left\|g_{n}(u)\right\|_{\mathrm{H}_{n}}=\left\|P_{n}\left[\Pi\left(g\left(|u|^{2}\right) u\right)\right]\right\|_{\mathrm{H}_{n}} \leq\left|\Pi\left(g\left(|u|^{2}\right) u\right)\right|_{\mathrm{H}} \leq\left|g\left(|u|^{2}\right) u\right|_{L^{2}} \\
& =\left[\int_{\mathbb{R}^{3}}\left|g\left(|u(x)|^{2}\right)\right|^{2}|u(x)|^{2} d x\right]^{1 / 2} \leq\left[\int_{\mathbb{R}^{3}}|u(x)|^{6} d x\right]^{1 / 2}=\|u\|_{L^{6}}^{3} \\
& \leq C\|u\|_{H^{1}}^{3}=C\left[\int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)|\hat{u}(\xi)|^{2} d \xi\right]^{3 / 2} \\
& =C\left[\int_{|\xi| \leq n}\left(1+|\xi|^{2}\right)|\hat{u}(\xi)|^{2} d \xi\right]^{3 / 2} \\
& \leq C\left(1+n^{2}\right)^{3 / 2}\left[\int_{|\xi| \leq n}|\hat{u}(\xi)|^{2} d \xi\right]^{3 / 2}=C\left(1+n^{2}\right)^{3 / 2}\left[\int_{\mathbb{R}^{3}}|\hat{u}(\xi)|^{2} d \xi\right]^{3 / 2} \\
& =C\left(1+n^{2}\right)^{3 / 2}|u|_{L^{2}}^{3}=C_{n}\|u\|_{\mathrm{H}_{n}}^{3}<\infty . \tag{4.13}
\end{align*}
$$

Therefore $g_{n}: \mathrm{H}_{n} \rightarrow \mathrm{H}_{n}$ is well defined. From above we can also infer that there exists a constant $C_{n}>0$ depending on $n$ such that

$$
\begin{equation*}
\|u\|_{H^{1}} \leq C_{n}\|u\|_{\mathrm{H}_{n}}, \quad u \in \mathrm{H}_{n} \tag{4.14}
\end{equation*}
$$

Let $R>0$ be fixed and $u, \mathrm{v} \in \mathbb{B}_{R}$. Then, using (2.16), we have

$$
\begin{aligned}
& \left\|g_{n}(u)-g_{n}(\mathrm{v})\right\|_{\mathrm{H}_{n}} \leq\left|\Pi\left(g\left(|u|^{2}\right) u\right)-\Pi\left(g\left(|\mathrm{v}|^{2}\right) \mathrm{v}\right)\right|_{\mathrm{H}} \\
& \quad \leq\left|g\left(|u|^{2}\right) u-g\left(|\mathrm{v}|^{2}\right) \mathrm{v}\right|_{L^{2}} \\
& \quad \leq\left|\left(g\left(|u|^{2}\right)-g\left(|\mathrm{v}|^{2}\right)\right) \mathrm{v}\right|_{L^{2}}+\left|g\left(|u|^{2}\right)(u-\mathrm{v})\right|_{L^{2}} \\
& \quad \leq 8\left[\int_{\mathbb{R}^{3}}|u(x)-\mathrm{v}(x)|^{2}\left[|u(x)|^{2}+|\mathrm{v}(x)|^{2}\right]|\mathrm{v}(x)|^{2} d x\right]^{1 / 2} \\
& \quad+\left[\int_{\mathbb{R}^{3}}|u(x)|^{4}|u(x)-\mathrm{v}(x)|^{2} d x\right]^{1 / 2} .
\end{aligned}
$$

Since $H^{1} \hookrightarrow L^{6}$, we obtain

$$
\begin{aligned}
& \left\|g_{n}(u)-g_{n}(\mathrm{v})\right\|_{\mathrm{H}_{n}} \leq\left[\int_{\mathbb{R}^{3}}|u(x)|^{6} d x\right]^{1 / 3}\left[\int_{\mathbb{R}^{3}}|u(x)-\mathrm{v}(x)|^{6} d x\right]^{1 / 6} \\
& \quad+8\left[\int_{\mathbb{R}^{3}}|u(x)-\mathrm{v}(x)|^{6} d x\right]^{1 / 6}\left[\left[\int_{\mathbb{R}^{3}}|u(x)|^{6} d x\right]^{1 / 3}\right.
\end{aligned}
$$

$$
\begin{aligned}
& \left.+\left[\int_{\mathbb{R}^{3}}|\mathrm{v}(x)|^{6} d x\right]^{1 / 3}\right]^{1 / 2}\left[\int_{\mathbb{R}^{3}}|\mathrm{v}(x)|^{6} d x\right]^{1 / 6} \\
= & {\left[\|u\|_{L^{6}}^{2}\|u-\mathrm{v}\|_{L^{6}}+8\|u-\mathrm{v}\|_{L^{6}}\left(\|u\|_{L^{6}}^{2}+\|\mathrm{v}\|_{L^{6}}^{2}\right)^{1 / 2}\|\mathrm{v}\|_{L^{6}}\right] } \\
\leq & C\|u-\mathrm{v}\|_{H^{1}}\left[\|u\|_{H^{1}}^{2}+8\left(\|u\|_{H^{1}}^{2}+\|\mathrm{v}\|_{H^{1}}^{2}\right)^{1 / 2}\|\mathrm{v}\|_{H^{1}}\right] .
\end{aligned}
$$

Since $u, \mathrm{v} \in \mathbb{B}_{R}$, using (4.14), we get

$$
\begin{align*}
\left\|g_{n}(u)-g_{n}(\mathrm{v})\right\|_{\mathrm{H}_{n}} & \leq \widehat{C}_{n}\|u-\mathrm{v}\|_{\mathrm{H}_{n}}\left[\|u\|_{\mathrm{H}_{n}}^{2}+8\left(\|u\|_{\mathrm{H}_{n}}^{2}+\|\mathrm{v}\|_{\mathrm{H}_{n}}^{2}\right)^{1 / 2}\|\mathrm{v}\|_{\mathrm{H}_{n}}\right] \\
& \leq C_{n, R}\|u-\mathrm{v}\|_{\mathrm{H}_{n}} . \tag{4.15}
\end{align*}
$$

Let $u \in \mathrm{H}_{n}$, then using Lemmas 4.2 and 4.3, the definitions of $g_{n}$ and $((\cdot, \cdot))$ we get

$$
\begin{aligned}
\left(\left(-g_{n}(u), u\right)\right) & =-\left\langle g_{n}(u),-\Delta u\right\rangle_{\mathrm{H}}=-\left\langle\Pi\left(g\left(|u|^{2}\right) u, P_{n}(-\Delta u)\right\rangle_{\mathrm{H}}\right. \\
& =-\left\langle g\left(|u|^{2}\right) u, \Pi(-\Delta u)\right\rangle_{L^{2}}=-\left\langle g\left(|u|^{2}\right) u,-\Delta u\right\rangle_{L^{2}} .
\end{aligned}
$$

Also, note that

$$
\begin{aligned}
& \left\langle-g_{n}(u), u\right\rangle_{\mathrm{H}}=-\left\langle\Pi\left(g\left(|u|^{2}\right)\right) u, P_{n} u\right\rangle_{\mathrm{H}} \\
& \quad=-\left\langle g\left(|u|^{2}\right) u, \Pi(u)\right\rangle_{L^{2}}=-\left\langle g\left(|u|^{2}\right) u, u\right\rangle_{L^{2}} .
\end{aligned}
$$

Hence the inequalities (4.12) can be established with the help of the above two relations and Lemma 2.1 (ii). This completes the proof of the lemma.

Lemma 4.7. Let $f$ satisfy the assumption (H1). Then the map

$$
\begin{equation*}
f_{n}: \mathrm{H}_{n} \ni u \mapsto P_{n}[\Pi(f(u))] \in \mathrm{H}_{n} \tag{4.16}
\end{equation*}
$$

is well defined and Lipschitz.
Proof. Let $u \in \mathrm{H}_{n}$, then by the assumption (H1),

$$
\begin{aligned}
\left\|f_{n}(u)\right\|_{\mathrm{H}_{n}} & \leq|\Pi(f(u))|_{\mathrm{H}} \leq|f(u)|_{L^{2}} \\
& \leq C\left(C_{f}|u|_{L^{2}}+\left|b_{f}\right|_{L^{1}}^{1 / 2}\right)=C\left(C_{f}\|u\|_{\mathrm{H}_{n}}+\left|b_{f}\right|_{L^{1}}^{1 / 2}\right)<\infty
\end{aligned}
$$

Therefore $f_{n}: \mathrm{H}_{n} \rightarrow \mathrm{H}_{n}$ is well defined. Let $u, \mathrm{v} \in \mathrm{H}_{n}$, then

$$
\begin{align*}
\left\|f_{n}(u)-f_{n}(\mathrm{v})\right\|_{\mathrm{H}_{n}} & \leq|\Pi f(u)-\Pi f(\mathrm{v})|_{\mathrm{H}} \leq|f(u)-f(\mathrm{v})|_{L^{2}} \\
& \leq C_{f}|u-\mathrm{v}|_{L^{2}}=C_{f}\|u-\mathrm{v}\|_{\mathrm{H}_{n}} . \tag{4.17}
\end{align*}
$$

Lemma 4.8. Let $\sigma$ satisfy the assumption (H2). Then the map

$$
\begin{equation*}
G_{n}: \mathrm{H}_{n} \ni u \mapsto P_{n} \circ(G(u)) \in \mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}_{n}\right) \tag{4.18}
\end{equation*}
$$

is well defined and Lipschitz.
Proof. Let $u \in \mathrm{H}_{n}$, then

$$
\left\|G_{n}(u)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}_{n}\right)} \leq\|(G(u))\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)} \leq\left[\int_{\mathbb{R}^{3}}\|\sigma(x)\|_{\ell^{2}}^{2}|\nabla u(x)|^{2} d x\right]^{1 / 2}
$$

$$
\leq\left[\sup _{x \in \mathbb{R}^{3}}\|\sigma(x)\|_{\ell^{2}}^{2}\right]^{1 / 2}|\nabla u|_{L^{2}} \leq \frac{1}{2}\|u\|_{H^{1}}
$$

Using (4.14), we infer

$$
\begin{equation*}
\left\|G_{n}(u)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}_{n}\right)} \leq C_{n}\|u\|_{\mathrm{H}_{n}}<\infty . \tag{4.19}
\end{equation*}
$$

Thus $G_{n}: \mathrm{H}_{n} \rightarrow \mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}_{n}\right)$ is well defined. Let $u, \mathrm{v} \in \mathrm{H}_{n}$, then

$$
\begin{aligned}
& \left\|G_{n}(u)-G_{n}(\mathrm{v})\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}_{n}\right)} \leq\|G(u)-G(\mathrm{v})\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)} \\
& \quad \leq\left[\int_{\mathbb{R}^{3}} \sum_{j=1}^{\infty}\left|\sigma_{j}(x)\right|^{2}|\nabla(u-\mathrm{v})(x)|^{2} d x\right]^{1 / 2} \\
& \quad=\left[\int_{\mathbb{R}^{3}}\|\sigma(x)\|_{\ell^{2}}^{2}|\nabla(u-\mathrm{v})(x)|^{2} d x\right]^{1 / 2} \\
& \quad \leq\left(\sup _{x \in \mathbb{R}^{3}}\|\sigma(x)\|_{\ell^{2}}^{2}\right)^{1 / 2}|\nabla(u-\mathrm{v})|_{L^{2}} \leq \frac{1}{2}\|u-\mathrm{v}\|_{H^{1}} .
\end{aligned}
$$

Using (4.14), we infer

$$
\begin{equation*}
\left\|G_{n}(u)-G_{n}(\mathrm{v})\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}_{n}\right)} \leq C_{n}\|u-\mathrm{v}\|_{\mathrm{H}_{n}} \tag{4.20}
\end{equation*}
$$

Proposition 4.9. $L^{2}, H^{1}$ and $\mathrm{D}(\mathrm{A})$ norms on $\mathrm{H}_{n}$ are equivalent (with constants depending on $n$ ).

Proof. Let $u \in \mathrm{H}_{n}$, then using the Parseval's identity

$$
\begin{equation*}
|u|_{L^{2}}=\left[\int_{\mathbb{R}^{3}}|\hat{u}(\xi)|^{2} d \xi\right]^{1 / 2}=\left[\int_{|\xi| \leq n}|\hat{u}(\xi)|^{2} d \xi\right]^{1 / 2}=\|u\|_{\mathrm{H}_{n}} \tag{4.21}
\end{equation*}
$$

Thus if $u \in \mathrm{H}_{n}$ then $L^{2}$ and $\mathrm{H}_{n}$ have equal norms. The equivalence of $H^{1}$ and $\mathrm{H}_{n}$ norms is established from (4.14). Using (4.5) and (4.21) we can establish equivalence of $\mathrm{D}(\mathrm{A})$ and $\mathrm{H}_{n}$ norms.

As discussed earlier in the introduction instead of using the standard Galerkin approximation of SPDE on the finite dimensional space we will look at truncated SPDEs on infinite dimensional space $H_{n}$. For every $n \in \mathbb{N}$, we will establish the existence of a unique global solution to the truncated SPDE and obtain a'priori estimates in order to prove the tightness of measures on a suitable space.

In order to study the truncated SPDE on $\mathrm{H}_{n}$ we project the SPDE (2.17) on $\mathrm{H}_{n}$ using $P_{n}$. The projected SPDE on $\mathrm{H}_{n}$ is given by

$$
\begin{gather*}
d u_{n}(t)=-\left[\mathrm{A}_{n} u_{n}(t)+B_{n}\left(u_{n}(t)\right)+g_{n}\left(u_{n}(t)\right)-f_{n}\left(u_{n}(t)\right)\right] d t \\
+G_{n}\left(u_{n}(t)\right) d W(t) \tag{4.22}
\end{gather*}
$$

$u_{n}(0)=P_{n}\left(u_{0}\right)$,
where $u_{n} \in \mathrm{H}_{n}, u_{0} \in \mathrm{~V}$ and other operators $\mathrm{A}_{n}, B_{n}, g_{n}, f_{n}$ and $G_{n}$ are as defined in Lemmas 4.4-4.8.

Lemma 4.10. Let us define $F: \mathrm{H}_{n} \rightarrow \mathbb{R}$ by

$$
\begin{equation*}
F(u):=\left\|G_{n}(u)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}_{n}\right)}+2\left\langle u,-\mathrm{A}_{n} u-B_{n}(u)-g_{n}(u)+f_{n}(u)\right\rangle_{\mathrm{H}} . \tag{4.23}
\end{equation*}
$$

Then for every $u \in \mathrm{H}_{n}$ there exists $K_{1}>0$, independent of $n$, such that

$$
\begin{equation*}
F(u) \leq K_{1}\left(1+\|u\|_{\mathrm{H}_{n}}^{2}\right) . \tag{4.24}
\end{equation*}
$$

Proof. From the definition of $B_{n}, g_{n}$ and $f_{n}$, we have

$$
\begin{aligned}
& \left\|G_{n}(u)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}_{n}\right)}+2\left\langle u,-\mathrm{A}_{n} u-B_{n}(u)-g_{n}(u)+f_{n}(u)\right\rangle_{\mathrm{H}} \\
& =\left\|G_{n}(u)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}_{n}\right)}+2\left\langle u,-\Pi(\Delta u)-P_{n}(B(u))\right\rangle_{\mathrm{H}} \\
& \quad-2\left\langle u, P_{n}\left[\Pi\left(g\left(|u|^{2}\right) u\right)\right]-P_{n}[\Pi(f(u))]\right\rangle_{\mathrm{H}} .
\end{aligned}
$$

Using Lemma 4.8 and since $u \in \mathrm{H}_{n}$, we get

$$
\begin{aligned}
F(u) & \leq \frac{1}{4}\|u\|_{\mathrm{H}_{n}}^{2}-2|\nabla u|_{L^{2}}^{2}-2\langle u, B(u)\rangle_{\mathrm{H}}-2\left\langle u, g\left(|u|^{2}\right) u\right\rangle_{\mathrm{H}}+2\langle u, f(u)\rangle_{\mathrm{H}} \\
& \leq \frac{3}{4}\|u\|_{\mathrm{H}_{n}}^{2}-2|\nabla u|_{L^{2}}^{2}-2\left|\sqrt{g\left(|u|^{2}\right)}\right| u\left\|_{L^{2}}^{2}+2 C_{f}\right\| u \|_{\mathrm{H}_{n}}^{2}+2\left|b_{f}\right|_{L^{1}}
\end{aligned}
$$

where in the last inequality we used the Young's inequality and hypothesis (H1). On rearranging, we get

$$
\begin{aligned}
& F(u)+2|\nabla u|_{L^{2}}^{2}+2\left|\sqrt{g\left(|u|^{2}\right)}\right| u\left\|_{L^{2}}^{2} \leq \frac{3}{4}\right\| u\left\|_{\mathrm{H}_{n}}^{2}+C_{f}\right\| u \|_{\mathrm{H}_{n}}^{2}+2\left|b_{f}\right|_{L^{1}} \\
& \quad \leq K_{1}\left(1+\|u\|_{\mathrm{H}_{n}}^{2}\right)
\end{aligned}
$$

for appropriately chosen $K_{1}$. Thus, in particular

$$
F(u) \leq K_{1}\left(1+\|u\|_{\mathrm{H}_{n}}^{2}\right) .
$$

We will use the following theorem from [1, Theorem 3.1] to prove Theorem 4.12. We have modified it in the way we will be using it.

Theorem 4.11. Let $X$ be an abstract Hilbert space. Assume that $\sigma$ and $b$ satisfy the following conditions
(i) For any $R>0$ there exists a constant $C>0$ such that

$$
\|\sigma(u)-\sigma(\mathrm{v})\|_{\mathcal{L}_{2}\left(\ell^{2} ; X\right)}+\|b(u)-b(\mathrm{v})\|_{X} \leq C\|u-\mathrm{v}\|_{X}^{2}, \quad\|u\|_{X},\|\mathrm{v}\|_{X} \leq R
$$

(ii) There exists a constant $K_{1}>0$ such that

$$
\|\sigma(u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; X\right)}^{2}+2\langle u, b(u)\rangle_{L^{2}} \leq K_{1}\left(1+\|u\|_{X}^{2}\right), \quad u \in X
$$

Then for any $X$-valued $\xi$, there exists a unique global solution $u=(u(t))_{t \geq 0}$ to

$$
u(t)=\xi+\int_{0}^{t} \sigma(u(s)) d W(s)+\int_{0}^{t} b(u(s)) d s
$$

Theorem 4.12. Let the assumptions $(\mathbf{H} 1)-(\mathbf{H} 2)$ hold. Then for every $u_{0} \in \mathrm{~V}$ there exists a unique global solution $u_{n}=\left(u_{n}(t)\right)_{t \geq 0}$ to

$$
\left\{\begin{align*}
u_{n}(t)= & \int_{0}^{t}\left[-\mathrm{A}_{n} u_{n}(s)-B_{n}\left(u_{n}(s)\right)-g_{n}\left(u_{n}(s)\right)+f_{n}\left(u_{n}(s)\right)\right] d s  \tag{4.25}\\
& \quad+\int_{0}^{t} G_{n}\left(u_{n}(s)\right) d W(s) \\
u_{n}(0)= & P_{n} u_{0}
\end{align*}\right.
$$

Proof. The proof is a direct application of Theorem 4.11. Using Lemmas 4.4 4.8, we can show that condition $(i)$ of Theorem 4.11 is satisfied. In Lemma 4.10 we proved that condition $(i i)$ is satisfied. Thus we have existence of the unique global solution $u_{n}=\left(u_{n}(t)\right)_{t \geq 0}$ to (4.25).

## 5. Existence of solution

### 5.1. A'priori estimates

In this subsection we will obtain certain a'priori estimates for the solution $u_{n}$ of (4.25). We will use these a'priori estimates in Lemma 5.3 to prove the tightness of measures on the space $\mathcal{Z}_{T}$, defined in (3.6). We will also establish certain higher order estimates which will be required to prove the convergence of non-linear terms in later sections.

Let us fix $T>0$. For any $R>0$, define the stopping time

$$
\begin{equation*}
\tau_{R}^{n}:=\inf \left\{t \in[0, T]:\left\|u_{n}(t)\right\|_{\mathrm{V}} \geq R\right\} \tag{5.1}
\end{equation*}
$$

where $u_{n}$ is the solution of (4.25). By the definition of a martingale solution one knows that for every $n \geq 1, \tau_{R}^{n} \nearrow \infty$ as $R \nearrow \infty$.

Lemma 5.1. Let $u_{n}$ be the solution of (4.25). For all $\rho>0$ there exist positive constants $C_{1}(\rho), C_{2}(\rho)$ such that if $\left\|u_{0}\right\|_{\mathrm{V}} \leq \rho$, then

$$
\begin{align*}
& \sup _{n \in \mathbb{N}} \mathbb{E}\left(\sup _{t \in[0, T]}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2}\right) \leq C_{1}(\rho),  \tag{5.2}\\
& \quad \sup _{n \in \mathbb{N}} \mathbb{E} \int_{0}^{T \wedge \tau_{R}^{n}}\left|u_{n}(t)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d t \leq C_{2}(\rho) . \tag{5.3}
\end{align*}
$$

Moreover, for every $\delta>0$ there exists a constant $C(\delta)>0$ such that if $\left|u_{0}\right|_{\mathrm{H}} \leq \delta$, then

$$
\begin{equation*}
\sup _{n \in \mathbb{N}} \mathbb{E} \int_{0}^{T \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{L^{4}}^{4} d s \leq C_{3}(\delta) \tag{5.4}
\end{equation*}
$$

Proof. Let $u_{n}(t), t \geq 0$ be the solution of (4.25) then applying the Itô formula to $\phi(\xi)=|\xi|_{\mathrm{H}}^{2}$ and the process $u_{n}(t)$, we get

$$
\begin{aligned}
\left|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}^{2} & =\left|P_{n} u_{0}\right|_{\mathrm{H}}^{2}+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\langle u_{n}(s),-\mathrm{A}_{n} u_{n}(s)-B_{n}\left(u_{n}(s)\right)\right\rangle_{\mathrm{H}} d s \\
& -2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\langle u_{n}(s), g_{n}\left(u_{n}(s)\right)-f_{n}\left(u_{n}(s)\right)\right\rangle_{\mathrm{H}} d s
\end{aligned}
$$

$$
\begin{align*}
& +\int_{0}^{t \wedge \tau_{R}^{n}}\left\|G_{n}\left(s, u_{n}(s)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d s \\
& +2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\langle u_{n}(s), G_{n}\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{H}} \tag{5.5}
\end{align*}
$$

Using Lemma 2.1, the Young's inequality, assumption (H1), boundedness of $P_{n}$ in H , we get

$$
\begin{align*}
& \left|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}^{2} \leq\left|u_{0}\right|_{\mathrm{H}}^{2}-2 \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s+C_{f} \int_{0}^{t \wedge \tau_{R}^{n}}\left|u_{n}(s)\right|_{\mathrm{H}}^{2} d s \\
& \quad+\int_{0}^{t \wedge \tau_{R}^{n}}\left|u_{n}(s)\right|_{\mathrm{H}}^{2} d s-2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\langle u_{n}(s), g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s)\right\rangle_{\mathrm{H}} d s \\
& \quad+\frac{1}{4} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{H}} \tag{5.6}
\end{align*}
$$

Using the $(4.12)_{2}$, we get

$$
\begin{aligned}
& \left|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}^{2} \leq\left|u_{0}\right|_{\mathrm{H}}^{2}-2 \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s-2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{L^{4}}^{4} d s \\
& +2 C_{N} \int_{0}^{t \wedge \tau_{R}^{n}}\left|u_{n}(s)\right|_{\mathrm{H}}^{2} d s+\int_{0}^{t \wedge \tau_{R}^{n}}\left(C_{f}\left|u_{n}(s)\right|_{\mathrm{H}}^{2}+\left|b_{f}\right|_{L^{1}}\right) d s+\int_{0}^{t \wedge \tau_{R}^{n}}\left|u_{n}(s)\right|_{\mathrm{H}}^{2} d s \\
& +\frac{1}{4} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{H}} .
\end{aligned}
$$

On rearranging we get

$$
\begin{align*}
& \left|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}^{2}+\frac{7}{4} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{L^{4}}^{4} d s \\
& \leq\left|u_{0}\right|_{\mathrm{H}}^{2}+T\left|b_{f}\right|_{L^{1}}+C_{f, N} \int_{0}^{t \wedge \tau_{R}^{n}}\left|u_{n}(s)\right|_{\mathrm{H}}^{2} d s \\
& \quad+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{H}} . \tag{5.7}
\end{align*}
$$

Now since

$$
\mu_{n}(t)=\int_{0}^{t \wedge \tau_{R}^{n}}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{H}}, \quad t \in[0, T]
$$

is a $\mathbb{F}$-martingale, as by Lemma 2.1 and (5.1) we have the following inequalities

$$
\begin{aligned}
& \mathbb{E} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\left\langle u_{n}(s), G\left(s, u_{n}(s)\right)\right\rangle_{\mathrm{H}}\right|^{2} d s \\
& \quad \leq \mathbb{E} \int_{0}^{t \wedge \tau_{R}^{n}}\left|u_{n}(s)\right|_{\mathrm{H}}^{2}\left\|G\left(s, u_{n}(s)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d s \\
& \quad \leq \frac{1}{4} \mathbb{E} \int_{0}^{t \wedge \tau_{R}^{n}}\left|u_{n}(s)\right|_{\mathrm{H}}^{2}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s<\infty,
\end{aligned}
$$

where to establish the last inequality we have used the equivalences of norm from Proposition 4.9. Thus, $\mathbb{E}\left[\mu_{n}(t)\right]=0$.

Hence applying Lemma 2.2 for the following three processes:

$$
\begin{aligned}
& X(t)=\left|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}^{2}, \\
& Y(t)=\frac{7}{4} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{L^{4}}^{4} d s
\end{aligned}
$$

and

$$
I(t)=2 \mu_{n}(t)=2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{H}}
$$

we obtain from (5.7), (2.26) is satisfied for $\alpha=1, Z=\left|u_{0}\right|_{\mathrm{H}}^{2}+T\left|b_{f}\right|_{L^{1}}$ and $\phi(r)=C_{f, N}$. Since $\mathbb{E}(I(t))=0,(2.27)$ is satisfied and hence all inequalities for the parameters (see (2.25)) are trivially satisfied. Thus, if $\left|u_{0}\right|_{\mathrm{H}} \leq \delta$, we have

$$
\begin{align*}
\sup _{n \in \mathbb{N}} \mathbb{E}\left[\mid u_{n}(t\right. & \left.\wedge \tau_{R}^{n}\right)\left.\right|_{\mathrm{H}} ^{2}+\frac{7}{4} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s \\
& \left.+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{L^{4}}^{4} d s\right] \leq C_{T}(\delta) \tag{5.8}
\end{align*}
$$

In particular,

$$
\begin{equation*}
\sup _{n \in \mathbb{N}}\left(\sup _{t \in[0, T]} \mathbb{E}\left|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}^{2}\right) \leq C_{T}(\delta) . \tag{5.9}
\end{equation*}
$$

Hence, using (5.8) and (5.9) we infer that

$$
\begin{equation*}
\sup _{n \in \mathbb{N}} \mathbb{E} \int_{0}^{T \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{L^{4}}^{4} d s \leq \widetilde{C}_{T}\left(\left|u_{0}\right|_{\mathrm{H}}^{2}\right)=: C_{3}(\delta) . \tag{5.10}
\end{equation*}
$$

Since we are interested in the estimates involving V norm of $u$. We apply the Itô formula to $\phi(\xi)=|\nabla \xi|_{L^{2}}^{2}$ and the process $u_{n}(t)$, obtaining

$$
\begin{align*}
& \left|\nabla u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{L^{2}}^{2}=\left|\nabla\left(P_{n} u_{0}\right)\right|_{L^{2}}^{2}+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left(\left(u_{n}(s),-\mathrm{A}_{n} u_{n}(s)\right)\right) d s \\
& \quad-2 \int_{0}^{t \wedge \tau_{R}^{n}}\left(\left(u_{n}(s), B_{n}\left(u_{n}(s)\right)\right)\right) d s-2 \int_{0}^{t \wedge \tau_{R}^{n}}\left(\left(u_{n}(s), g_{n}\left(u_{n}(s)\right)\right)\right) d s \\
& \quad+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left(\left(u_{n}(s), f_{n}\left(u_{n}(s)\right)\right)\right) d s+\int_{0}^{t \wedge \tau_{R}^{n}}\left\|\nabla\left(G_{n}\left(s, u_{n}(s)\right)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; H\right)}^{2} d s \\
& \quad+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left(\left(u_{n}(s), G_{n}\left(s, u_{n}(s)\right) d W_{s}\right)\right) \tag{5.11}
\end{align*}
$$

where $((\cdot, \cdot))$ is as defined in (2.1).
Using Lemma 2.1, assumptions (H1) - (H2), boundedness of $P_{n}$ in H, estimates (4.8), (4.12), the Cauchy-Schwarz and the Young's inequality, we get

$$
\left|\nabla u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{L^{2}}^{2} \leq\left|\nabla u_{0}\right|_{L^{2}}^{2}-2 \int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2} d s+\int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2}
$$

$$
\begin{aligned}
& +\left.\int_{0}^{t \wedge \tau_{R}^{n}}| | u_{n}(s)|\cdot| \nabla u_{n}(s)\right|_{L^{2}} ^{2} d s+2 C_{N} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s \\
& -\left.4 \int_{0}^{t \wedge \tau_{R}^{n}}| | u_{n}(s)|\cdot| \nabla u_{n}(s)\right|_{L^{2}} ^{2} d s+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}\left|f\left(u_{n}(s)\right)\right|_{L^{2}} d s \\
& +\frac{1}{2} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2} d s+C_{T, \sigma} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s \\
& +2 \int_{0}^{t \wedge \tau_{R}^{n}}\left(\left(u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right)\right)
\end{aligned}
$$

i.e.,

$$
\begin{aligned}
& \left|\nabla u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{L^{2}}^{2} \leq\left|\nabla u_{0}\right|_{L^{2}}^{2}-\frac{1}{2} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2} d s \\
& \quad-\left.3 \int_{0}^{t \wedge \tau_{R}^{n}}| | u_{n}(s)|\cdot| \nabla u_{n}(s)\right|_{L^{2}} ^{2} d s+C_{T, \sigma, N} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s \\
& \quad+\frac{1}{4} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2} d s+\int_{0}^{t \wedge \tau_{R}^{n}}\left(C_{f}\left|u_{n}(s)\right|_{\mathrm{H}}^{2}+\left|b_{f}\right|_{L^{1}}\right) d s \\
& \quad+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left(\left(u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right)\right) .
\end{aligned}
$$

On rearranging, we have

$$
\begin{align*}
& \left|\nabla u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{L^{2}}^{2}+\left.3 \int_{0}^{t \wedge \tau_{R}^{n}}| | u_{n}(s)|\cdot| \nabla u_{n}(s)\right|_{L^{2}} ^{2} d s \\
& \quad+\frac{1}{4} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2} d s \\
& \leq\left|\nabla u_{0}\right|_{L^{2}}^{2}+T\left|b_{f}\right|_{L^{1}}+C_{T, \sigma, N} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s \\
& \quad+C_{f} \int_{0}^{t \wedge \tau_{R}^{n}}\left|u_{n}(s)\right|_{\mathrm{H}}^{2} d s+2 \int_{0}^{t \wedge \tau_{R}^{n}}\left(\left(u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right)\right) \tag{5.12}
\end{align*}
$$

Now since the process

$$
\mu_{n}(t)=\int_{0}^{t \wedge \tau_{R}^{n}}\left(\left(u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right)\right), \quad t \in[0, T]
$$

is a $\mathbb{F}$-martingale, as by Lemma 2.1 and (5.1) we have the following inequalities

$$
\begin{aligned}
& \mathbb{E} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\left(\left(u_{n}(s), G\left(s, u_{n}(s)\right)\right)\right)\right|^{2} d s \\
& \quad \leq \mathbb{E} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2}\left\|G\left(s, u_{n}(s)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d s \\
& \quad \leq \frac{1}{4} \mathbb{E} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s<\infty
\end{aligned}
$$

where to establish the last inequality we have used the equivalences of norm from Proposition 4.9. Thus, $\mathbb{E}\left[\mu_{n}(t)\right]=0$.

Again as before, by applying Lemma 2.2 to processes

$$
\begin{aligned}
& X(t)=\left|\nabla u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{L^{2}}^{2} \\
& Y(t)=\frac{1}{4} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2} d s+3 \int_{0}^{t \wedge \tau_{R}^{n}}| | u_{n}(s)|\cdot| \nabla u_{n}(s) \|_{L^{2}}^{2} d s
\end{aligned}
$$

and

$$
I(t)=2 \mu_{n}(t)=2 \int_{0}^{t \wedge \tau_{R}^{n}}\left(\left(u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right)\right), \quad t \geq 0
$$

the inequalities (2.26) and (2.27) are satisfied. Thus, from (5.9) and (5.11), if $\left\|u_{0}\right\|_{\mathrm{V}} \leq \rho$, then

$$
\begin{align*}
& \sup _{n \in \mathbb{N}} \mathbb{E}\left[\left|\nabla u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{L^{2}}^{2}+\frac{1}{4} \int_{0}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2} d s\right. \\
& \left.\quad+\left.3 \int_{0}^{t \wedge \tau_{R}^{n}}| | u_{n}(s)|\cdot| \nabla u_{n}(s)\right|_{L^{2}} ^{2} d s\right] \leq C_{T}(\rho) \tag{5.13}
\end{align*}
$$

In particular,

$$
\begin{equation*}
\sup _{n \in \mathbb{N}}\left(\sup _{t \in[0, T]} \mathbb{E}\left|\nabla u_{n}\left(t \wedge \tau_{R}^{n}\right)\right|_{L^{2}}^{2}\right) \leq C_{T}(\rho) . \tag{5.14}
\end{equation*}
$$

From (5.14) and (5.13), we have the following estimate

$$
\begin{equation*}
\sup _{n \in \mathbb{N}} \mathbb{E} \int_{0}^{T \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(t)\right|_{L^{2}}^{2} d t \leq C_{T}(\rho) . \tag{5.15}
\end{equation*}
$$

Note that $|u|_{\mathrm{D}(\mathrm{A})}^{2}:=|u|_{L^{2}}^{2}+|\mathrm{A} u|_{L^{2}}^{2}$. Thus from (5.9) and (5.15) we can infer (5.3). On combining (5.9) and (5.14), we get

$$
\begin{equation*}
\sup _{n \in \mathbb{N}}\left(\sup _{t \in[0, T]} \mathbb{E}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2}\right) \leq C_{T}(\rho) . \tag{5.16}
\end{equation*}
$$

Using the Burkholder-Davis-Gundy inequality, the definition of $\langle\cdot, \cdot\rangle_{\mathrm{V}}$ and the Young's inequality, for every $\varepsilon>0$ we obtain

$$
\begin{aligned}
& \mathbb{E} \sup _{t \in[0, T]} \int_{0}^{t \wedge \tau_{R}^{n}}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{V}} \\
& \quad \leq \mathbb{E}\left[\int_{0}^{T \wedge \tau_{R}^{n}}\left|\left\langle u_{n}(s), G\left(s, u_{n}(s)\right)\right\rangle_{\mathrm{H}}+\left(\left(u_{n}(s), G\left(s, u_{n}(s)\right)\right)\right)\right|^{2} d s\right]^{1 / 2} \\
& \quad \leq \mathbb{E}\left[\int_{0}^{T \wedge \tau_{R}^{n}}\left\|G\left(s, u_{n}(s)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right]^{1 / 2} \\
& \quad \leq \mathbb{E}\left[\frac{1}{4} \int_{0}^{T \wedge \tau_{R}^{n}}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right]^{1 / 2}
\end{aligned}
$$

$$
\begin{align*}
& \leq \frac{1}{2} \mathbb{E}\left[\sup _{s \in[0, T]}\left|\nabla u_{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{L^{2}}^{2} \int_{0}^{T \wedge \tau_{R}^{n}}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right]^{1 / 2} \\
& \leq \varepsilon \mathbb{E} \sup _{s \in[0, T]}\left|\nabla u_{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{L^{2}}^{2}+C_{\varepsilon} \mathbb{E} \int_{0}^{T \wedge \tau_{R}^{n}}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s . \tag{5.17}
\end{align*}
$$

On combining (5.7) and (5.12), then using (5.3), (5.9), (5.14), (5.17) and Lemma 2.2, we can infer (5.2).

In the next lemma we will use the estimates from Lemma 5.1 to establish higher order estimates.

Lemma 5.2. Let $\tau_{R}^{n}$ be as defined in (5.1). For all $\rho>0$ and $p \in[1,3]$ there exist positive constants $C_{1}(p, \rho), C_{2}(p, \rho)$ such that if $\left\|u_{0}\right\|_{\mathrm{V}} \leq \rho$, then

$$
\begin{align*}
& \sup _{n \in \mathbb{N}} \mathbb{E}\left(\sup _{t \in[0, T]}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p}\right) \leq C_{1}(p, \rho),  \tag{5.18}\\
& \sup _{n \in \mathbb{N}} \mathbb{E} \int_{0}^{T \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|\mathrm{A} u_{n}(s)\right|_{L^{2}}^{2} d s \leq C_{2}(p, \rho) . \tag{5.19}
\end{align*}
$$

Proof. Let $p \in[1, \infty)$. Then by using the Itô formula for $\xi(t)=\left\|u_{n}(t)\right\|_{\mathrm{V}}^{2}$, $\phi(x)=x^{p}$, equations (5.5), (5.11) and the definition of $\|\cdot\|_{\mathrm{V}}$, we obtain

$$
\begin{align*}
\| & u_{n}\left(t \wedge \tau_{R}^{n}\right) \|_{\mathrm{V}}^{2 p} \\
= & \left\|u_{n}(0)\right\|_{\mathrm{V}}^{2 p}-2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left(\left|\nabla u_{n}(s)\right|_{L^{2}}^{2}+\left|\mathrm{A} u_{n}(s)\right|_{L^{2}}^{2}\right) d s \\
& -2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), B_{n}\left(u_{n}(s)\right)\right\rangle_{\mathrm{V}} d s \\
& -2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), g_{n}\left(u_{n}(s)\right)\right\rangle_{\mathrm{V}} d s \\
& -2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), f_{n}\left(u_{n}(s)\right)\right\rangle_{\mathrm{V}} d s \\
& +p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\|G_{n}\left(s, u_{n}(s)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{V}\right)}^{2} d s \\
& +2 p(p-1) \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-2)}\left\langle u_{n}(s), G_{n}\left(s, u_{n}(s)\right)\right\rangle_{\mathrm{V}}^{2} d s \\
& +2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), G_{n}\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{V}} \tag{5.20}
\end{align*}
$$

Using Lemma 2.1, boundedness of $P_{n}$ in V and assumption (H1), we can simplify (5.20)

$$
\begin{aligned}
& \left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p} \\
& \quad \leq\left\|u_{n}(0)\right\|_{\mathrm{V}}^{2 p}-2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left(\left|\nabla u_{n}(s)\right|_{L^{2}}^{2}+\left|\mathrm{A} u_{n}(s)\right|_{L^{2}}^{2}\right) d s
\end{aligned}
$$

$$
\begin{aligned}
& +2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left[\frac{1}{2}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2}+\frac{1}{2}| | u_{n}(s)|\cdot| \nabla u_{n}(s) \|_{L^{2}}^{2}\right] d s \\
& -2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s)\right\rangle_{\mathrm{V}} d s \\
& +2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left(C_{f}\left|u_{n}(s)\right|_{\mathrm{H}}^{2}+\left|b_{f}\right|_{L^{1}}+\frac{1}{4}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2}\right) d s \\
& +p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left[\frac{1}{2}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2}+C_{T, \sigma}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2}\right] d s \\
& +2 p(p-1) \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|^{2(p-2)}\left\|G\left(s, u_{n}(s)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{V}\right)}^{2}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2} d s \\
& +2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle \mathrm{V} .
\end{aligned}
$$

On rearranging, we get

$$
\begin{aligned}
& \left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p} \\
& \leq\left\|u_{n}(0)\right\|_{\mathrm{V}}^{2 p}-\frac{p}{2} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|\mathrm{A} u_{n}(s)\right|_{L^{2}}^{2} d s \\
& \\
& -2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|^{2(p-1)}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s \\
& +p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\|u_{n}(s)|\cdot| \nabla u_{n}(s)\right\|_{L^{2}}^{2} d s \\
& \\
& -2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}| | \sqrt{g\left(\left|u_{n}(s)\right|^{2}\right)|\cdot| u_{n}(s) \|_{L^{2}}^{2} d s} \\
& +C_{N} \cdot 2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s \\
& \\
& -4 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}| | u_{n}(s)|\cdot| \nabla u_{n}(s) \|_{L^{2}}^{2} d s \\
& +2 p C_{f} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|u_{n}(s)\right|_{\mathrm{H}}^{2} d s+2 p\left|b_{f}\right|_{L^{1}} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)} d s \\
& +p C_{T, \sigma} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s \\
& \\
& +2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{V}} \\
& \\
& +2 p(p-1) \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|^{2(p-1)}\left[\frac{1}{4}\left|\mathrm{~A} u_{n}(s)\right|_{L^{2}}^{2}+C_{T, \sigma}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2}\right] d s
\end{aligned}
$$

which on further simplification yields

$$
\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p}+\frac{p(3-p)}{2} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|\mathrm{A} u_{n}(s)\right|_{L^{2}}^{2} d s
$$

$$
\begin{align*}
& +3 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}| | u_{n}(s)|\cdot| \nabla u_{n}(s) \|_{L^{2}}^{2} d s \\
& +2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}| | \sqrt{g\left(\left|u_{n}(s)\right|^{2}\right) \mid}|\cdot| u_{n}(s) \|_{L^{2}}^{2} d s \\
& \leq\left\|u_{n}(0)\right\|_{\mathrm{V}}^{2 p}+C_{T, \sigma, N, p} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s \\
& +C_{f} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|u_{n}(s)\right|_{\mathrm{H}}^{2} d s+2 p\left|b_{f}\right|_{L^{1}} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)} d s \\
& +2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle \mathrm{V} \tag{5.21}
\end{align*}
$$

As before we will show that

$$
\mu_{n}\left(t \wedge \tau_{R}^{n}\right)=\int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{V}}, \quad t \in[0, T]
$$

is a $\mathbb{F}$-martingale. By Lemma 2.1 and (5.1) we have the following inequalities

$$
\begin{aligned}
\mathbb{E} \int_{0}^{t \wedge \tau_{R}^{n}} & \left\|u_{n}(s)\right\|_{\mathrm{V}}^{4(p-1)}\left|\left\langle u_{n}(s), G\left(s, u_{n}(s)\right)\right\rangle_{\mathrm{V}}\right|^{2} d s \\
\quad & \leq \mathbb{E} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{4(p-1)}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2}\left\|G\left(s, u_{n}(s)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d s \\
\quad & \leq \frac{1}{4} \mathbb{E} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{4(p-1)}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2} d s<\infty
\end{aligned}
$$

where the finiteness of the integral follows from Proposition 4.9. Hence, $\mathbb{E}\left[\mu_{n}(t)\right]=0$.

Since $\left|u_{n}(s)\right|_{\mathrm{H}} \leq\left\|u_{n}(s)\right\|_{\mathrm{V}}$ and $\left|\nabla u_{n}(s)\right|_{L^{2}} \leq\left\|u_{n}(s)\right\|_{\mathrm{V}}$ on applying the modified version of the Gronwall Lemma (Lemma 2.2) for

$$
\begin{aligned}
& X(t)=\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p} \\
& I(t)=2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{V}}
\end{aligned}
$$

and

$$
\begin{aligned}
Y(t) & =\frac{p(3-p)}{2} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|\mathrm{A} u_{n}(s)\right|_{L^{2}}^{2} d s \\
& +3 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}| | u_{n}(s)|\cdot| \nabla u_{n}(s) \|_{L^{2}}^{2} d s \\
& +2 p \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}| | \sqrt{g\left(|u(s)|^{2}\right)}|\cdot| u(s) \|_{L^{2}}^{2} d s
\end{aligned}
$$

we have

$$
\begin{equation*}
\sup _{n \in \mathbb{N}}\left(\sup _{t \in[0, T]} \mathbb{E}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p}\right) \leq C_{T, p}\left\|u_{0}\right\|_{\mathrm{V}}^{2 p}, \quad p \in[1,3] . \tag{5.22}
\end{equation*}
$$

Using (5.22) in (5.20), we also obtain

$$
\begin{align*}
& \sup _{n \in \mathbb{N}} \mathbb{E} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|\mathrm{A} u_{n}(s)\right|_{L^{2}}^{2} d s \\
& \quad \leq C_{T, p}\left\|u_{0}\right\|_{\mathrm{V}}^{2 p}:=C_{2}(p, \rho), \quad p \in[1,3] \tag{5.23}
\end{align*}
$$

Now we are left to show the estimate (5.18). Using the Burkholder-Davis- Gundy inequality, Lemma 2.1, we get

$$
\begin{aligned}
& \mathbb{E} \sup _{t \in[0, T]} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{V}} \\
& \quad \leq \mathbb{E}\left[\int_{0}^{T \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{4(p-1)}\left|\left\langle u_{n}(s), G\left(s, u_{n}(s)\right)\right\rangle_{\mathrm{V}}\right|^{2} d s\right]^{1 / 2} \\
& \quad \leq \mathbb{E}\left[\int_{0}^{T \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{4(p-1)}\left\|G\left(s, u_{n}(s)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right]^{1 / 2} \\
& \quad \leq \frac{1}{4} \mathbb{E}\left[\int_{0}^{T \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{4(p-1)}\left|\nabla u_{n}(s)\right|_{L^{2}}^{2}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right]^{1 / 2}
\end{aligned}
$$

Using the definition of V-norm, the Hölder inequality and the Young's inequality, for $\varepsilon>0$ we obtain

$$
\begin{align*}
& \mathbb{E} \sup _{t \in[0, T]} \int_{0}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left\langle u_{n}(s), G\left(s, u_{n}(s)\right) d W_{s}\right\rangle_{\mathrm{V}} \\
& \leq \frac{1}{4} \mathbb{E}\left[\int_{0}^{T \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2 p}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right]^{1 / 2} \\
& \leq \frac{1}{4} \mathbb{E}\left[\sup _{t \in[0, T]}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p} \int_{0}^{T \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|_{\mathrm{V}}^{2(p-1)}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right]^{1 / 2} \\
& \leq \varepsilon \mathbb{E} \sup _{t \in[0, T]}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p}+C_{\varepsilon} \mathbb{E} \int_{0}^{T \wedge \tau_{R}^{n}}\left\|u_{n}(s)\right\|^{2(p-1)}\left|u_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s \tag{5.24}
\end{align*}
$$

Thus from (5.21) and using (5.23), (5.24) and Lemma 2.2, we have

$$
\begin{aligned}
& \mathbb{E}\left(\sup _{t \in[0, T]}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p}\right) \\
& \quad \leq C_{T, p}\left(\mathbb{E}\left\|u_{0}\right\|_{\mathrm{V}}^{2 p}\right)+\varepsilon \mathbb{E}\left(\sup _{t \in[0, T]}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p}\right)+C_{T, p, \varepsilon}
\end{aligned}
$$

Choosing $\varepsilon$ small enough we get

$$
\begin{equation*}
\sup _{n \in \mathbb{N}} \mathbb{E}\left(\sup _{t \in[0, T]}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2 p}\right) \leq C_{T, p}\left(\left\|u_{0}\right\|_{\mathrm{V}}^{2 p}\right):=C_{1}(p, \rho), \quad p \in[1,3] \tag{5.25}
\end{equation*}
$$

### 5.2. Tightness of measures

For each $n \in \mathbb{N}$, the solution $u_{n}$ of the truncated equation (4.25) defines a measure $\operatorname{law}\left(u_{n}\right)$ on $\left(\mathcal{Z}_{T}, \mathcal{T}\right)$, where $\mathcal{Z}_{T}$ was defined in (3.6) as

$$
\mathcal{Z}_{T}=\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{~A})) \cap L^{2}\left(0, T ; \mathrm{H}_{l o c}\right) \cap \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)
$$

In this subsection we will prove that this sequence of measures defined on $\mathcal{Z}_{T}$ is tight.

Lemma 5.3. The set of measures $\left\{\operatorname{law}\left(u_{n}\right), n \in \mathbb{N}\right\}$ is tight on $\left(\mathcal{Z}_{T}, \mathcal{T}\right)$.
Proof. We recall the definition of the stopping time, $\tau_{R}^{n}$

$$
\tau_{R}^{n}:=\inf \left\{t \in[0, T]:\left\|u_{n}(t)\right\|_{\mathrm{v}} \geq R\right\}
$$

We will use Corollary 3.9 to prove the tightness of measures. According to estimates (5.2) and (5.3), conditions (a) and (b) are satisfied. Thus it is sufficient to prove that the sequence $\left(u_{n}\right)_{n \in \mathbb{N}}$ satisfies the Aldous condition [A] in H. By (4.25), for $t \in\left[0, T \wedge \tau_{R}^{n}\right]$ we have

$$
\begin{aligned}
u_{n}(t) & =u_{n}(0)-\int_{0}^{t} \mathrm{~A}_{n} u_{n}(s) d s-\int_{0}^{t} B_{n}\left(u_{n}(s)\right) d s-\int_{0}^{t} g_{n}\left(u_{n}(s)\right) d s \\
& +\int_{0}^{t} f_{n}\left(u_{n}(s)\right) d s+\int_{0}^{t} G_{n}\left(s, u_{n}(s)\right) d W(s) \\
& :=J_{1}^{n}+J_{2}^{n}(t)+J_{3}^{n}(t)+J_{4}^{n}(t)+J_{5}^{n}(t)+J_{6}^{n}(t), \quad t \in\left[0, T \wedge \tau_{R}^{n}\right]
\end{aligned}
$$

Let $s, t \in[0, T], s<t$ and $\theta:=t-s$. First we will establish estimates for each term of the above equality. Ad. $J_{2}^{n}$. Since A : V $\rightarrow \mathrm{V}^{\prime}$, then by the Hölder inequality and (5.3), we have the following inequalities

$$
\begin{align*}
& \mathbb{E}\left[\left|J_{2}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{2}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}\right]=\mathbb{E}\left|\int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}} \mathrm{~A}_{n} u_{n}(r) d r\right|_{\mathrm{H}} \\
& \quad \leq c \mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left|\mathrm{~A} u_{n}(r)\right|_{\mathrm{H}} d r \leq c \theta^{\frac{1}{2}}\left(\mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left|u_{n}(r)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d r\right)^{\frac{1}{2}} \\
& \quad \leq c\left(C_{2}(R)\right)^{\frac{1}{2}} \cdot \theta^{1 / 2}:=c_{2} \cdot \theta^{1 / 2} \tag{5.26}
\end{align*}
$$

Ad. $J_{3}^{n} . B: \mathrm{D}(\mathrm{A}) \times \mathrm{V} \rightarrow \mathrm{H}$ is bilinear and continuous and $P_{n}: \mathrm{H} \rightarrow \mathrm{H}$ is bounded then by Lemma 4.5, the Cauchy-Schwarz inequality and (5.2) we have

$$
\mathbb{E}\left[\left|J_{3}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{3}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}\right]=\mathbb{E}\left|\int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}} P_{n} B\left(u_{n}(r)\right) d r\right|_{\mathrm{H}}
$$

$$
\begin{align*}
& \leq \mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left|P_{n} B\left(u_{n}(r), u_{n}(r)\right)\right|_{\mathrm{H}} d r \\
& \leq \mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\|B\| \cdot\left|u_{n}(r)\right|_{\mathrm{D}(\mathrm{~A})}\left\|u_{n}(r)\right\|_{\mathrm{V}} d r \\
& \leq C \mathbb{E}\left(\left[\sup _{t \in[0, T]}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2}\right]^{1 / 2} \cdot \theta^{1 / 2}\left[\int_{0}^{t \wedge \tau_{R}^{n}}\left|u_{n}(r)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d r\right]^{1 / 2}\right) \\
& \leq\left(C_{1}(R)\right)^{1 / 2}\left(C_{2}(R)\right)^{1 / 2} \cdot \theta^{1 / 2}:=c_{3} \cdot \theta^{1 / 2} . \tag{5.27}
\end{align*}
$$

Ad. $J_{4}^{n}$. Since $H^{1} \hookrightarrow L^{6}$ then by the definition of $g$ and estimate (5.18) (for $p=2$ ), we have

$$
\begin{align*}
\mathbb{E} & {\left[\left|J_{4}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{4}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}\right]=\mathbb{E}\left|\int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}} g_{n}\left(u_{n}(r)\right) d r\right|_{\mathrm{H}} } \\
& \leq \mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left|P_{n}\left(\Pi g\left(\left|u_{n}(r)\right|^{2}\right) u_{n}(r)\right)\right|_{\mathrm{H}} d r \leq \mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left|g\left(\left|u_{n}(r)\right|^{2}\right) u_{n}(r)\right|_{L^{2}} d r \\
& \leq \mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left(\int_{\mathbb{R}^{3}}\left|u_{n}(r, x)\right|^{6} d x\right)^{1 / 2} d r=\mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(r)\right\|_{L^{6}}^{3} d s \\
& \leq C \mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left\|u_{n}(r)\right\|_{\mathrm{V}}^{3} d r \leq C T^{1 / 2}\left[\mathbb{E}\left(\sup _{t \in[0, T]}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{4}\right)\right]^{3 / 4} \theta^{1 / 2} \\
& \leq C \cdot\left(C_{1}(2, R)\right)^{3 / 4} \cdot \theta^{1 / 2}:=c_{4} \cdot \theta^{1 / 2} \tag{5.28}
\end{align*}
$$

Ad. $J_{5}^{n}$. Using the assumption H1, (5.9) and the Cauchy-Schwarz inequality, we obtain the following inequalities

$$
\begin{align*}
& \mathbb{E}\left[\left|J_{5}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{5}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}\right]=\mathbb{E}\left|\int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}} P_{n}\left(\Pi f\left(u_{n}(r)\right) d r\right)\right|_{\mathrm{H}} \\
& \quad \leq \mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left|f\left(u_{n}(r)\right)\right|_{\mathrm{H}} d r \leq \mathbb{E}\left(\int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left|f\left(u_{n}(r)\right)\right|_{\mathrm{H}}^{2} d r\right)^{1 / 2} \cdot \theta^{1 / 2} \\
& \quad \leq\left(C_{f} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left|u_{n}(r)\right|_{\mathrm{H}}^{2} d r+T\left|b_{f}\right|_{L^{1}}\right)^{1 / 2} \theta^{\frac{1}{2}} \\
& \quad \leq\left(C_{f}+\left|b_{f}\right|_{L^{1}}\right)^{1 / 2} T^{1 / 2}(C(R))^{1 / 2} \theta^{1 / 2}:=c_{5} \cdot \theta^{1 / 2} \tag{5.29}
\end{align*}
$$

Ad. $J_{6}^{n}$. Using the Itô isometry, Lemma 2.1 and (5.2), we obtain the following

$$
\begin{aligned}
\mathbb{E} & {\left[\left|J_{6}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{6}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}^{2}\right]=\mathbb{E}\left|\int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}} G_{n}\left(r, u_{n}(r)\right) d W(r)\right|_{\mathrm{H}}^{2} } \\
& =\mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left\|P_{n} G\left(r, u_{n}(r)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d r \leq \frac{1}{4} \mathbb{E} \int_{s \wedge \tau_{R}^{n}}^{t \wedge \tau_{R}^{n}}\left|\nabla u_{n}(r)\right|_{L^{2}}^{2} d r
\end{aligned}
$$

$$
\begin{equation*}
\leq \frac{1}{4} \mathbb{E}\left(\sup _{t \in[0, T]}\left\|u_{n}\left(t \wedge \tau_{R}^{n}\right)\right\|_{\mathrm{V}}^{2}\right) \theta \leq \frac{1}{4} C_{1}(R) \cdot \theta:=c_{6} \cdot \theta \tag{5.30}
\end{equation*}
$$

Let us fix $\kappa>0$ and $\varepsilon>0$. By the Chebyshev's inequality and estimates (5.26) - (5.29), we obtain

$$
\begin{aligned}
& \mathbb{P}\left(\left\{\left|J_{i}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{i}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}} \geq \kappa\right\}\right) \\
& \quad \leq \frac{1}{\kappa} \mathbb{E}\left[\left|J_{i}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{i}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}\right] \leq \frac{c_{i} \theta^{1 / 2}}{\kappa} ; \quad n \in \mathbb{N},
\end{aligned}
$$

where $i=2, \ldots, 5$. Let $\delta_{i}=\frac{\kappa^{2}}{c_{i}^{2}} \varepsilon^{2}$. Then

$$
\sup _{n \in \mathbb{N}} \sup _{0 \leq \theta \leq \delta_{i}} \mathbb{P}\left(\left\{\left|J_{i}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{i}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}} \geq \kappa\right\}\right) \leq \varepsilon, i=2 \ldots 5
$$

By the Chebyshev inequality and (5.30), we have

$$
\begin{aligned}
& \mathbb{P}\left(\left\{\left|J_{6}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{6}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}} \geq \kappa\right\}\right) \\
& \quad \leq \frac{1}{\kappa^{2}} \mathbb{E}\left[\left|J_{6}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{6}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}}^{2}\right] \leq \frac{c_{6} \theta}{\kappa^{2}} ; \quad n \in \mathbb{N}
\end{aligned}
$$

Let $\delta_{6}=\frac{\kappa^{2}}{c_{6}} \varepsilon$. Then

$$
\sup _{n \in \mathbb{N}} \sup _{0 \leq \theta \leq \delta_{6}} \mathbb{P}\left(\left\{\left|J_{6}^{n}\left(t \wedge \tau_{R}^{n}\right)-J_{6}^{n}\left(s \wedge \tau_{R}^{n}\right)\right|_{\mathrm{H}} \geq \kappa\right\}\right) \leq \varepsilon
$$

Since $[\mathbf{A}]$ holds for each term $J_{i}^{n}, i=1,2, \ldots, 6$; we infer that it holds also for $\left(u_{n}\right)_{n \in \mathbb{N}}$. Thus, the proof of lemma can be concluded by invoking Corollary 3.9.

Now we will state the main theorem of this section.
Theorem 5.4. Let assumptions (H1) and (H2) be satisfied. Then there exists a martingale solution $(\widehat{\Omega}, \widehat{\mathcal{F}}, \widehat{\mathbb{F}}, \widehat{\mathbb{P}}, \widehat{u})$ of problem (2.17) such that

$$
\begin{equation*}
\hat{\mathbb{E}}\left[\sup _{t \in[0, T]}\|\widehat{u}(t)\|_{\mathrm{V}}^{2}+\int_{0}^{T}|\widehat{u}(t)|_{\mathrm{D}(\mathrm{~A})}^{2} d t\right]<\infty \tag{5.31}
\end{equation*}
$$

In the following subsection we will prove Theorem 5.4 in several steps.

### 5.3. Proof of Theorem 5.4

By Lemma 5.3 the set of measures $\left\{\operatorname{law}\left(u_{n}\right), n \in \mathbb{N}\right\}$ is tight on the space $\left(\mathcal{Z}_{T}, \mathcal{T}\right)$ defined by (3.6). Hence by Corollary 3.11 there exists a subsequence $\left(n_{k}\right)_{k \in \mathbb{N}}$, a probability space $(\widetilde{\Omega}, \widetilde{\mathcal{F}}, \widetilde{\mathbb{P}})$ and, on this space, $\mathcal{Z}_{T}$-valued random variables $\widetilde{u}, \widetilde{u}_{n_{k}}, k \geq 1$ such that

$$
\begin{equation*}
\widetilde{u}_{n_{k}} \text { has the same law as } u_{n_{k}} \text { and } \widetilde{u}_{n_{k}} \rightarrow \widetilde{u} \text { in } \mathcal{Z}_{T}, \quad \widetilde{\mathbb{P}} \text {-a.s. } \tag{5.32}
\end{equation*}
$$

$\widetilde{u}_{n_{k}} \rightarrow \widetilde{u}$ in $\mathcal{Z}_{T} \widetilde{\mathbb{P}}$-a.s. precisely means that

$$
\begin{aligned}
& \widetilde{u}_{n_{k}} \rightarrow \widetilde{u} \text { in } \mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right), \\
& \widetilde{u}_{n_{k}} \rightharpoonup \widetilde{u} \text { in } L^{2}(0, T ; \mathrm{D}(\mathrm{~A})),
\end{aligned}
$$

$$
\begin{aligned}
& \widetilde{u}_{n_{k}} \rightarrow \widetilde{u} \text { in } L^{2}\left(0, T ; \mathrm{H}_{l o c}\right), \\
& \widetilde{u}_{n_{k}} \rightarrow \widetilde{u} \text { in } \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right) .
\end{aligned}
$$

Let us denote the subsequence $\left(\widetilde{u}_{n_{k}}\right)$ again by $\left(\widetilde{u}_{n}\right)_{n \in \mathbb{N}}$.
By Theorem B.1, $\mathcal{C}\left([0, T] ; \mathrm{H}_{n}\right)$ is a Borel subset of $\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L^{2}\left(0, T ; \mathrm{H}_{\text {loc }}\right)$. Since $u_{n} \in \mathcal{C}\left([0, T] ; \mathrm{H}_{\mathrm{n}}\right), \mathbb{P}$-a.s., and $\widetilde{u}_{n}, u_{n}$ have the same laws on $\mathcal{Z}_{T}$, thus

$$
\begin{equation*}
\operatorname{law}\left(\widetilde{u}_{n}\right)\left(\mathcal{C}\left([0, T] ; \mathrm{H}_{\mathrm{n}}\right)\right)=1, \quad n \in \mathbb{N} \tag{5.33}
\end{equation*}
$$

Since $\mathcal{C}([0, T] ; \mathrm{V}) \cap \mathcal{Z}_{T}$ and $L^{2}(0, T ; \mathrm{D}(\mathrm{A})) \cap \mathcal{Z}_{\mathrm{T}}$ are Borel subsets of $\mathcal{Z}_{T}$ (Theorem B.1) and $\widetilde{u}_{n}$ and $u_{n}$ have the same laws on $\mathcal{Z}_{T}$; from (5.18) and (5.3), we have for $p \in[1,3]$

$$
\begin{align*}
& \sup _{n \in \mathbb{N}} \widetilde{\mathbb{E}}\left(\sup _{0 \leq s \leq T}\left\|\widetilde{u}_{n}(s)\right\|_{\mathrm{V}}^{2 p}\right) \leq C_{1}(p)  \tag{5.34}\\
& \sup _{n \in \mathbb{N}} \widetilde{\mathbb{E}}\left[\int_{0}^{T}\left|\widetilde{u}_{n}(s)\right|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right] \leq C_{2}\left(\left\|u_{0}\right\|_{\mathrm{V}}^{2}\right) \tag{5.35}
\end{align*}
$$

Also, $\mathcal{C}\left([0, T] ; \mathrm{H}_{n}\right)$ is continuously embedded in $L^{4}\left(0, T ; L^{4}\right)$ and $\widetilde{u}_{n}, u_{n}$ have same law $\mu$ on $\mathcal{C}\left([0, T] ; \mathrm{H}_{n}\right)$, therefore we have

$$
\begin{aligned}
& \widetilde{\mathbb{E}} \int_{0}^{T}\left\|\widetilde{u}_{n}(s)\right\|_{L^{4}}^{4} d s=\int_{\widetilde{\Omega}}\left[\int_{0}^{T}\left\|\widetilde{u}_{n}(s, \omega)\right\|_{L^{4}}^{4} d s\right] d \widetilde{\mathbb{P}}(\omega) \\
& \quad=\int_{L^{4}\left(0, T ; L^{4}\right)}\left[\int_{0}^{T}\|y\|_{L^{4}}^{4} d s\right] d \mu(y)=\int_{\mathcal{C}\left([0, T] ; \mathrm{H}_{n}\right)}\left[\int_{0}^{T}\|y\|_{L^{4}}^{4} d s\right] d \mu(y) \\
& \quad=\int_{L^{4}\left(0, T ; L^{4}\right)}\left[\int_{0}^{T}\|y\|_{L^{4}}^{4} d s\right] d \mu(y)=\int_{\Omega}\left[\int_{0}^{T}\left\|u_{n}(s, \omega)\right\|_{L^{4}}^{4} d s\right] d \mathbb{P}(\omega) \\
& \quad=\mathbb{E} \int_{0}^{T}\left\|u_{n}(s)\right\|_{L^{4}}^{4} d s .
\end{aligned}
$$

Thus, by estimate (5.4) we infer

$$
\begin{equation*}
\sup _{n \in N} \widetilde{\mathbb{E}} \int_{0}^{T}\left\|\widetilde{u}_{n}(s)\right\|_{L^{4}}^{4} d s \leq C_{3}\left(\left|u_{0}\right|_{\mathrm{H}}^{2}\right) . \tag{5.36}
\end{equation*}
$$

By inequality (5.35) we infer that the sequence ( $\widetilde{u}_{n}$ ) contains a subsequence, still denoted by $\left(\widetilde{u}_{n}\right)$ convergent weakly in $L^{2}([0, T] \times \widetilde{\Omega} ; \mathrm{D}(\mathrm{A}))$. Since by (5.32) $\widetilde{\mathbb{P}}$-a.s $\widetilde{u}_{n} \rightarrow \widetilde{u}$ in $\mathcal{Z}_{T}$, we conclude that $\widetilde{u} \in L^{2}([0, T] \times \widetilde{\Omega} ; \mathrm{D}(\mathrm{A}))$, i.e.

$$
\begin{equation*}
\widetilde{\mathbb{E}}\left[\int_{0}^{T}|\widetilde{u}(s)|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right]<\infty . \tag{5.37}
\end{equation*}
$$

Similarly by inequality (5.34) for $p=1$ we can choose a subsequence of $\left(\widetilde{u}_{n}\right)$ convergent weak star in the space $L^{2}\left(\widetilde{\Omega} ; L^{\infty}(0, T ; \mathrm{V})\right)$ and, using (5.32), we infer that

$$
\begin{equation*}
\widetilde{\mathbb{E}}\left(\sup _{0 \leq s \leq T}\|\widetilde{u}(s)\|_{\mathrm{V}}^{2}\right)<\infty . \tag{5.38}
\end{equation*}
$$

For each $n \geq 1$, let us consider a process $\widetilde{M}_{n}$ with trajectories in $\mathcal{C}\left([0, T] ; \mathrm{H}_{n}\right)$ in particular in $\mathcal{C}([0, T] ; \mathrm{H})$ defined by

$$
\begin{align*}
\widetilde{M}_{n}(t)= & \widetilde{u}_{n}(t)-P_{n} \widetilde{u}(0)+\int_{0}^{t} \mathrm{~A} \widetilde{u}_{n}(s) d s+\int_{0}^{t} B_{n}\left(\widetilde{u}_{n}(s)\right) d s \\
& +\int_{0}^{t} g_{n}\left(\widetilde{u}_{n}(s)\right) d s-\int_{0}^{t} f_{n}\left(\widetilde{u}_{n}(s)\right) d s, \quad t \in[0, T] \tag{5.39}
\end{align*}
$$

Lemma 5.5. $\widetilde{M}_{n}$ is a square integrable martingale with respect to the filtration $\widetilde{\mathbb{F}}_{n}=\left(\widetilde{\mathcal{F}}_{n, t}\right)$, where $\widetilde{\mathcal{F}}_{n, t}=\sigma\left\{\widetilde{u}_{n}(s), s \leq t\right\}$, with the quadratic variation

$$
\begin{equation*}
\left\langle\left\langle\widetilde{M}_{n}\right\rangle\right\rangle_{t}=\int_{0}^{t}\left\|G_{n}\left(s, \widetilde{u}_{n}(s)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d s \tag{5.40}
\end{equation*}
$$

Proof. Indeed since $\widetilde{u}_{n}$ and $u_{n}$ have the same laws, for all $s, t \in[0, T], s \leq t$, then for all bounded continuous functions $h$ on $\mathcal{C}\left([0, s] ; \mathrm{V}_{w}\right)$, and all $\psi, \zeta \in \mathrm{V}_{\gamma}$ ( $\gamma>\frac{d}{2}$ ), we have

$$
\begin{equation*}
\widetilde{\mathbb{E}}\left[\left\langle\widetilde{M}_{n}(t)-\widetilde{M}_{n}(s), \psi\right\rangle h\left(\widetilde{u}_{n \mid[0, s]}\right)\right]=0 \tag{5.41}
\end{equation*}
$$

and

$$
\begin{align*}
\widetilde{\mathbb{E}} & {[ } \\
& \left\langle\widetilde{M}_{n}(t), \psi\right\rangle\left\langle\widetilde{M}_{n}(t), \zeta\right\rangle-\left\langle\widetilde{M}_{n}(s), \psi\right\rangle\left\langle\widetilde{M}_{n}(s), \zeta\right\rangle  \tag{5.42}\\
& \left.\left.-\int_{s}^{t}\left\langle\left(G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right)^{*} P_{n} \psi,\left(G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right)^{*} P_{n} \zeta\right\rangle_{\ell^{2}} d \sigma\right) \cdot h\left(\widetilde{u}_{n \mid[0, s]}\right)\right]=0 .
\end{align*}
$$

Lemma 5.6. Let us define a process $\widetilde{M}$ for $t \in[0, T]$ by

$$
\begin{align*}
\widetilde{M}(t) & =\widetilde{u}(t)-\widetilde{u}(0)+\int_{0}^{t} \mathrm{~A} \widetilde{u}(s) d s+\int_{0}^{t} B(\widetilde{u}(s)) d s \\
& +\int_{0}^{t} \Pi\left(g\left(|\widetilde{u}(s)|^{2}\right) \widetilde{u}(s)\right) d s-\int_{0}^{t} \Pi f(\widetilde{u}(s)) d s \tag{5.43}
\end{align*}
$$

Then $\widetilde{M}$ is a H -valued continuous process.
Proof. Since $\widetilde{u} \in \mathcal{C}([0, T] ; \mathrm{V})$ we just need to show that the remaining terms on the r.h.s. of (5.43) are H -valued a.s. and well-defined.

Using the Cauchy-Schwarz inequality repeatedly and (5.37) we have the following inequalities

$$
\widetilde{\mathbb{E}} \int_{0}^{T}|\mathrm{~A} \widetilde{u}(s)|_{\mathrm{H}} d s \leq T^{1 / 2}\left(\widetilde{\mathbb{E}} \int_{0}^{T}|\widetilde{u}(s)|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right)^{1 / 2}<\infty
$$

Since $H^{k, p}\left(\mathbb{R}^{d}\right) \hookrightarrow L^{\infty}\left(\mathbb{R}^{d}\right)$ for every $k>d / p$, hence there exists a $C>0$ such that $\|u\|_{L^{\infty}} \leq C\|u\|_{H^{2,2}}$ for every $u \in H^{2,2}\left(\mathbb{R}^{3}\right)$. Thus by the CauchySchwarz inequality, (5.37) and (5.38) we obtain the following estimate

$$
\begin{aligned}
& \widetilde{\mathbb{E}} \int_{0}^{T}|B(\widetilde{u}(s))|_{\mathrm{H}} d s \leq T^{1 / 2} \widetilde{\mathbb{E}}\left(\int_{0}^{T}|\widetilde{u}(s) \cdot \nabla \widetilde{u}(s)|_{L^{2}}^{2} d s\right)^{1 / 2} \\
& \quad \leq T^{1 / 2} \widetilde{\mathbb{E}}\left(\int_{0}^{T}\|\widetilde{u}(s)\|_{L^{\infty}}^{2}|\nabla \widetilde{u}(s)|_{L^{2}}^{2} d s\right)^{1 / 2} \\
& \quad \leq T^{1 / 2} C \widetilde{\mathbb{E}}\left(\int_{0}^{T}|\widetilde{u}(s)|_{\mathrm{D}(\mathrm{~A})}^{2}\|\widetilde{u}(s)\|_{\mathrm{V}}^{2} d s\right)^{1 / 2} \\
& \quad \leq T^{1 / 2} C\left[\widetilde{\mathbb{E}} \sup _{s \in[0, T]}\|\widetilde{u}(s)\|_{\mathrm{V}}^{2}\right]^{1 / 2}\left[\widetilde{\mathbb{E}} \int_{0}^{T}|\widetilde{u}(s)|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right]^{1 / 2}<\infty
\end{aligned}
$$

We know that for $d=3, H^{1,2} \hookrightarrow L^{6}$, thus using (2.15), (5.32) and (5.34), we get

$$
\begin{aligned}
\widetilde{\mathbb{E}} \int_{0}^{T}\left|\Pi g\left(|\widetilde{u}(s)|^{2}\right) \widetilde{u}(s)\right|_{\mathrm{H}} d s \leq \widetilde{\mathbb{E}} \int_{0}^{T}\left|g\left(|\widetilde{u}(s)|^{2}\right) \widetilde{u}(s)\right|_{L^{2}} d s \\
\quad \leq \widetilde{\mathbb{E}} \int_{0}^{T}\|\widetilde{u}(s)\|_{L^{6}}^{3} d s \leq C \widetilde{\mathbb{E}} \int_{0}^{T}\|\widetilde{u}(s)\|_{\mathrm{V}}^{3} d s \\
\quad \leq C\left(\widetilde{\mathbb{E}} \sup _{s \in[0, T]}\|\widetilde{u}(s)\|_{\mathrm{V}}^{4}\right)^{3 / 4} T<\infty .
\end{aligned}
$$

Using the assumptions (H1) and (5.38) we can show that

$$
\begin{aligned}
& \widetilde{\mathbb{E}} \int_{0}^{T}|\Pi f(\widetilde{u}(s))|_{\mathrm{H}} d s \leq \widetilde{\mathbb{E}} \int_{0}^{T}|f(\widetilde{u}(s))|_{L^{2}} d s \\
& \leq T^{1 / 2} \widetilde{\mathbb{E}}\left(\int_{0}^{T}|f(\widetilde{u}(s))|_{L^{2}}^{2} d s\right)^{1 / 2} \leq T^{1 / 2}\left(\widetilde{\mathbb{E}} \int_{0}^{T}\left(C_{f}|\widetilde{u}(s)|_{\mathrm{H}}^{2}+\left|b_{f}\right|_{L^{1}}\right) d s\right)^{1 / 2}<\infty
\end{aligned}
$$

This concludes the proof of the lemma.
Lemma 5.7. Let $\gamma>\frac{3}{2}, u \in L^{2}(0, T ; \mathrm{H}) \cap L^{4}\left(0, T ; L^{4}\right)$ and $\left(u_{n}\right)_{n \in \mathbb{N}}$ be a bounded sequence in $L^{2}(0, T ; H) \cap L^{4}\left(0, T ; L^{4}\right)$ such that $u_{n} \rightarrow u$ in $L^{2}\left(0, T ; \mathrm{H}_{\text {loc }}\right)$. Then for all $r, t \in[0, T]$ and all $\psi \in \mathrm{V}_{\gamma}$ :

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s), \psi\right\rangle d s=\int_{r}^{t}\left\langle g\left(|u(s)|^{2}\right) u(s), \psi\right\rangle d s \tag{5.44}
\end{equation*}
$$

Here $\langle\cdot, \cdot\rangle$ denotes the duality pairing between $\mathrm{V}_{\gamma}$ and $\mathrm{V}_{\gamma}^{\prime}$.
Proof. We will prove the lemma in two steps.
Step I
Let us fix $\gamma>\frac{3}{2}$ and $r, t \in[0, T]$. Assume first that $\psi \in \mathcal{V}$. Then there exists a
$R>0$ such that $\operatorname{supp}(\psi)$ is a compact subset of $\mathcal{O}_{R}$. There exists a constant $C \geq 0$ such that

$$
\begin{align*}
& \left|\left\langle g\left(|u|^{2}\right) u, \psi\right\rangle\right|=\left|\int_{\mathcal{O}_{R}} g\left(|u(x)|^{2}\right) u(x) \psi(x) d x\right| \\
& \quad \leq\left|g\left(|u|^{2}\right)\right|_{L^{2}\left(\mathcal{O}_{R}\right)}|u|_{L^{2}\left(\mathcal{O}_{R}\right)}^{2}\|\psi\|_{L^{\infty}\left(\mathcal{O}_{R}\right)} \leq\left||u|^{2}\right|_{L^{2}\left(\mathcal{O}_{R}\right)}|u|_{L^{2}\left(\mathcal{O}_{R}\right)}\|\psi\|_{L^{\infty}} \\
& \quad \leq C\|u\|_{L^{4}}^{2}|u|_{L^{2}\left(\mathcal{O}_{R}\right)}\|\psi\|_{\mathrm{V}_{\gamma}}, \quad u \in \mathrm{H} \cap L^{4}, \tag{5.45}
\end{align*}
$$

where we used (2.8) to establish the last inequality. We have

$$
g\left(\left|u_{n}\right|^{2}\right) u_{n}-g\left(|u|^{2}\right) u=g\left(\left|u_{n}\right|^{2}\right)\left(u_{n}-u\right)+\left[g\left(\left|u_{n}\right|^{2}\right)-g\left(|u|^{2}\right)\right] u
$$

Thus using the estimate (5.45), the Hölder inequality, (2.16) and the CauchySchwarz inequality, we obtain

$$
\begin{aligned}
&\left|\int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s), \psi\right\rangle d s-\int_{r}^{t}\left\langle g_{n}\left(|u(s)|^{2}\right) u(s), \psi\right\rangle d s\right| \\
& \leq\left|\int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right)\left(u_{n}(s)-u(s)\right), \psi\right\rangle d s\right| \\
&+\left|\int_{r}^{t}\left\langle\left(g\left(\left|u_{n}(s)\right|^{2}\right)-g\left(|u(s)|^{2}\right)\right) u(s), \psi\right\rangle d s\right| \\
& \leq C \int_{r}^{t}\left\|u_{n}(s)\right\|_{L^{4}}^{2}\left|u_{n}(s)-u(s)\right|_{L^{2}\left(\mathcal{O}_{R}\right)} \mid\|\psi\|_{\mathrm{V}_{\gamma}} d s \\
&\left.+2 \int_{r}^{t}\left|\langle | u_{n}(s)-u(s)\right|\left(\left|u_{n}(s)\right|+|u(s)|\right) u(s), \psi\right\rangle \mid d s \\
& \leq C\|\psi\|_{\mathrm{V}_{\gamma}} \int_{r}^{t}\left\|u_{n}(s)\right\|_{L^{4}}^{2}\left|u_{n}(s)-u(s)\right|_{L^{2}\left(\mathcal{O}_{R}\right)} d s \\
& \quad+2 C\|\psi\|_{\mathrm{V}_{\gamma}} \int_{r}^{t}\left|u_{n}(s)-u(s)\right|_{L^{2}\left(\mathcal{O}_{R}\right)}\left|u(s)\left[\left|u_{n}(s)\right|+|u(s)|\right]\right|_{L^{2}\left(\mathcal{O}_{R}\right)} d s . \\
& \leq C\|\psi\|_{\mathrm{V}_{\gamma}}\left[\left|u_{n}\right|_{L^{4}\left(0, T ; L^{4}\right)}^{2}\left|u_{n}-u\right|_{L^{2}\left(0, T ; L^{2}\left(\mathcal{O}_{R}\right)\right)}\right. \\
& \quad\left.+2\left|u_{n}-u\right|_{L^{2}\left(0, T ; L^{2}\left(\mathcal{O}_{R}\right)\right)}\left[\int_{r}^{t}\left|u(s)\left[\left|u_{n}(s)\right|+|u(s)|\right]\right|_{L^{2}\left(\mathcal{O}_{R}\right)}^{2} d s\right]^{1 / 2}\right] \\
& \leq C\left[\left|u_{n}\right|_{L^{4}\left(0, T ; L^{4}\right)}^{2}+2|u|_{L^{4}\left(0, T ; L^{4}\right)}^{2}\left(\left|u_{n}\right|_{L^{4}\left(0, T ; L^{4}\right)}^{2}+|u|_{L^{4}\left(0, T ; L^{4}\right)}^{2}\right)^{1 / 2}\right] \\
& \times\left|u_{n}-u\right|_{L^{2}\left(0, T ; L^{2}\left(\mathcal{O}_{R}\right)\right)}\|\psi\|_{\mathrm{V}_{\gamma}} .
\end{aligned}
$$

Since $u_{n} \rightarrow u$ in $L^{2}\left(0, T ; \mathrm{H}_{l o c}\right)$ we infer that (5.44) holds for every $\psi \in \mathcal{V}$. Step II
Let $\psi \in \mathrm{V}_{\gamma}$ and $\varepsilon>0$. Then there exists a $\psi_{\varepsilon} \in \mathcal{V}$ such that $\left\|\psi_{\varepsilon}-\psi\right\|_{\mathrm{V}_{\gamma}}<\varepsilon$. Hence, we get

$$
\begin{aligned}
& \left|\left\langle g\left(\left|u_{n}\right|^{2}\right) u_{n}-g\left(|u|^{2}\right) u, \psi\right\rangle\right| \\
& \quad \leq\left|\left\langle g\left(\left|u_{n}\right|^{2}\right) u_{n}-g\left(|u|^{2}\right) u, \psi_{\varepsilon}\right\rangle\right|+\left|\left\langle g\left(\left|u_{n}\right|^{2}\right) u_{n}-g\left(|u|^{2}\right) u, \psi-\psi_{\varepsilon}\right\rangle\right|
\end{aligned}
$$

$$
\begin{align*}
\leq & \left|\left\langle g\left(\left|u_{n}\right|^{2}\right) u_{n}-g\left(|u|^{2}\right) u, \psi_{\varepsilon}\right\rangle\right| \\
& +\left[\left\|g\left(\left|u_{n}\right|^{2}\right) u_{n}\right\|_{\mathrm{V}_{\gamma}^{\prime}}+\left\|g\left(|u|^{2}\right) u\right\|_{\mathrm{V}_{\gamma}^{\prime}}\right]\left\|\psi-\psi_{\varepsilon}\right\|_{\mathrm{V}_{\gamma}} \tag{5.46}
\end{align*}
$$

Since $\mathcal{V}$ is dense in $\mathrm{V}_{\gamma},(5.45)$ holds for all $\psi \in \mathrm{V}_{\gamma}$. In particular, there exists a constant $C>0$ such that

$$
\begin{equation*}
\left\|g\left(|u|^{2}\right) u\right\|_{\mathrm{V}_{\gamma}^{\prime}} \leq C\|u\|_{L^{4}}^{2}|u|_{\mathrm{H}}, \quad u \in \mathrm{H} \cap L^{4} \tag{5.47}
\end{equation*}
$$

Using (5.46), (5.47) and the Cauchy-Schwarz inequality we have following inequalities

$$
\begin{aligned}
& \left|\int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s)-g\left(|u(s)|^{2}\right) u(s), \psi\right\rangle d s\right| \\
& \leq \varepsilon C \int_{r}^{t}\left(\left\|u_{n}(s)\right\|_{L^{4}}^{2}\left|u_{n}(s)\right|_{\mathrm{H}}+\|u(s)\|_{L^{4}}^{2}|u(s)|_{\mathrm{H}}\right) d s \\
& +\left|\int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s)-g\left(|u(s)|^{2}\right) u(s), \psi_{\varepsilon}\right\rangle d s\right| \\
& \quad \leq \varepsilon C\left[\left\|u_{n}\right\|_{L^{4}\left(0, T ; L^{4}\right)}^{2}\left\|u_{n}\right\|_{L^{2}(0, T ; \mathrm{H})}+\|u\|_{L^{4}\left(0, T ; L^{4}\right)}^{2}\|u\|_{L^{2}(0, T ; \mathrm{H})}\right] \\
& \quad+\left|\int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s)-g\left(|u(s)|^{2}\right) u(s), \psi_{\varepsilon}\right\rangle d s\right|
\end{aligned}
$$

Hence by Step I and the assumptions on $u, u_{n}$ there exists a $M>0$ such that

$$
\limsup _{n \rightarrow \infty}\left|\int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s)-g\left(|u(s)|^{2}\right) u(s), \psi\right\rangle d s\right| \leq M \varepsilon
$$

Since $\varepsilon>0$ is arbitrary we conclude the proof.
Corollary 5.8. Let $\gamma>\frac{3}{2}$, $u \in L^{2}(0, T ; \mathrm{H}) \cap L^{4}\left(0, T ; L^{4}\right)$ and $\left(u_{n}\right)_{n \in \mathbb{N}}$ be a bounded sequence in $L^{2}(0, T ; H) \cap L^{4}\left(0, T ; L^{4}\right)$ such that $u_{n} \rightarrow u$ in $L^{2}\left(0, T ; \mathrm{H}_{\text {loc }}\right)$. Then for all $r, t \in[0, T]$ and all $\psi \in \mathrm{V}_{\gamma}$

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s), P_{n} \psi\right\rangle d s=\int_{r}^{t}\left\langle g\left(|u(s)|^{2}\right) u(s), \psi\right\rangle d s \tag{5.48}
\end{equation*}
$$

Here $\langle\cdot, \cdot\rangle$ denotes the dual pairing between $\mathrm{V}_{\gamma}$ and $\mathrm{V}_{\gamma}^{\prime}$.
Proof. Let us fix $\gamma>\frac{3}{2}$ and take $r, t \in[0, T]$ and $\psi \in \mathrm{V}_{\gamma}$. We have

$$
\begin{aligned}
& \int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s), P_{n} \psi\right\rangle d s \\
& \quad=\int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s), P_{n} \psi-\psi\right\rangle d s+\int_{r}^{t}\left\langle g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s), \psi\right\rangle d s \\
& \quad:=I_{1}(n)+I_{2}(n)
\end{aligned}
$$

We will consider each of these integrals individually. Using the estimate from (5.47), we have

$$
\left|I_{1}(n)\right| \leq \int_{r}^{t}\left\|g\left(\left|u_{n}(s)\right|^{2}\right) u_{n}(s)\right\|_{\mathrm{V}_{\gamma}^{\prime}}\left\|P_{n} \psi-\psi\right\|_{\mathrm{V}_{\gamma}} d s
$$

$$
\leq\left\|P_{n} \psi-\psi\right\|_{\mathrm{V}_{\gamma}} \int_{r}^{t}\left\|u_{n}(s)\right\|_{L^{4}}^{2}\left|u_{n}(s)\right|_{\mathrm{H}} d s
$$

Since the sequence $\left(u_{n}\right)_{n \in \mathbb{N}}$ is bounded in $L^{2}(0, T ; \mathrm{H}) \cap L^{4}\left(0, T ; L^{4}\right)$ and $P_{n} \psi \rightarrow \psi$ in $V_{\gamma}$, we infer that $\lim _{n \rightarrow \infty} I_{1}(n)=0$. By Lemma 5.7 we infer that

$$
\lim _{n \rightarrow \infty} I_{2}(n)=\int_{r}^{t}\left\langle g\left(|u(s)|^{2}\right) u(s), \psi\right\rangle d s
$$

Lemma 5.9. For all $s, t \in[0, T]$ such that $s \leq t$ and $\gamma>3 / 2$ :
(a) $\lim _{n \rightarrow \infty}\left\langle\widetilde{u}_{n}(t), P_{n} \psi\right\rangle=\langle\widetilde{u}(t), \psi\rangle, \widetilde{\mathbb{P}}$-a.s., $\psi \in \mathrm{V}$,
(b) $\lim _{n \rightarrow \infty} \int_{s}^{t}\left\langle\mathrm{~A} \widetilde{u}_{n}(\sigma), P_{n} \psi\right\rangle_{\mathrm{H}} d s=\int_{s}^{t}\langle\mathrm{~A} \widetilde{u}(\sigma), \psi\rangle_{\mathrm{H}} d \sigma, \widetilde{\mathbb{P}}-a . s ., \psi \in \mathrm{H}$,
(c) $\lim _{n \rightarrow \infty} \int_{s}^{t}\left\langle B\left(\widetilde{u}_{n}(\sigma)\right), P_{n} \psi\right\rangle d \sigma=\int_{s}^{t}\langle B(\widetilde{u}(\sigma)), \psi\rangle d \sigma, \widetilde{\mathbb{P}}$-a.s., $\psi \in \mathrm{V}_{\gamma}$,
(d) $\lim _{n \rightarrow \infty} \int_{s}^{t}\left\langle g\left(\left|\widetilde{u}_{n}(\sigma)\right|^{2}\right) \widetilde{u}_{n}(\sigma), P_{n} \psi\right\rangle d \sigma=\int_{s}^{t}\left\langle g\left(|\widetilde{u}(\sigma)|^{2}\right) \widetilde{u}(\sigma), \psi\right\rangle d \sigma, \widetilde{\mathbb{P}}-a . s .$, $\psi \in \mathrm{V}_{\gamma}$,
(e) $\lim _{n \rightarrow \infty} \int_{s}^{t}\left\langle f\left(\widetilde{u}_{n}(\sigma)\right), P_{n} \psi\right\rangle d \sigma=\int_{s}^{t}\langle f(\widetilde{u}(\sigma)), \psi\rangle d \sigma, \widetilde{\mathbb{P}}$-a.s., $\psi \in \mathrm{V}_{\gamma}$, where $\langle\cdot, \cdot\rangle$ denotes the duality pairing between appropriate spaces.

Proof. Let us fix $s, t \in[0, T], s \leq t$ and $\gamma>\frac{3}{2}$. By (5.32) we know that $\mathbb{P}$-a.s.

$$
\begin{equation*}
\widetilde{u}_{n} \rightarrow \widetilde{u} \text { in } \mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{~A})) \cap L^{2}\left(0, T ; \mathrm{H}_{l o c}\right) \cap \mathcal{C}\left([0, T] ; V_{w}\right) . \tag{5.49}
\end{equation*}
$$

Let $\psi \in \mathrm{V}$. Since $\widetilde{u}_{n} \rightarrow \widetilde{u}$ in $\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right) \widetilde{\mathbb{P}}$-a.s., from (5.34) $\widetilde{u}_{n}$ is uniformly bounded in $\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$ and $P_{n} \psi \rightarrow \psi$ in V , thus

$$
\begin{aligned}
& \lim _{n \rightarrow \infty}\left\langle\widetilde{u}_{n}(t), P_{n} \psi\right\rangle-\langle\widetilde{u}(t), \psi\rangle \\
& =\lim _{n \rightarrow \infty}\left\langle\widetilde{u}_{n}(t)-\widetilde{u}(t), \psi\right\rangle+\lim _{n \rightarrow \infty}\left\langle\widetilde{u}_{n}(t), P_{n} \psi-\psi\right\rangle=0 \quad \widetilde{\mathbb{P}} \text {-a.s. }
\end{aligned}
$$

Hence we infer that assertion (a) holds.
Let $\psi \in \mathrm{H}$. Since by (5.49) $\widetilde{u}_{n} \rightarrow \widetilde{u}$ in $L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{A})) \widetilde{\mathbb{P}}$-a.s., from (5.35) $\widetilde{u}_{n}$ is uniformly bounded in $L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ and $P_{n} \psi \rightarrow \psi$ in H. Thus, we have, $\widetilde{\mathbb{P}}$-a.s.,

$$
\begin{aligned}
& \lim _{n \rightarrow \infty} \int_{s}^{t}\left\langle\mathrm{~A} \widetilde{u}_{n}(\sigma), P_{n} \psi\right\rangle_{\mathrm{H}} d \sigma-\int_{s}^{t}\langle\mathrm{~A} \widetilde{u}(\sigma), \psi\rangle_{\mathrm{H}} d \sigma \\
& =\lim _{n \rightarrow \infty} \int_{s}^{t}\left\langle\mathrm{~A} \widetilde{u}_{n}(\sigma)-\mathrm{A} \widetilde{u}(\sigma), \psi\right\rangle_{\mathrm{H}} d \sigma+\lim _{n \rightarrow \infty} \int_{s}^{t}\left\langle\mathrm{~A} \widetilde{u}_{n}(\sigma), P_{n} \psi-\psi\right\rangle_{\mathrm{H}} d \sigma \\
& =0
\end{aligned}
$$

Hence, we have shown that assertion (b) is true.
Assertion (c) follows directly for every $\psi \in \mathrm{V}_{\gamma}$ from [8, Lemma B.1] and a modification of Corollary 5.8.

By (5.49) $\widetilde{u}_{n} \rightarrow \widetilde{u}$ in $L^{2}\left(0, T ; \mathrm{H}_{l o c}\right)$. From Lemma 5.1, (5.32) and (5.36) the sequence $\left(\widetilde{u}_{n}\right)$ is bounded in $L^{2}(0, T ; \mathrm{H}) \cap L^{4}\left(0, T ; L^{4}\right)$ and $\widetilde{u} \in L^{2}(0, T ; \mathrm{H}) \cap$ $L^{4}\left(0, T ; L^{4}\right)$. Thus, using Corollary 5.8 we infer that (d) holds for every $\psi \in \mathrm{V}_{\gamma}$.

Now we are left to deal with $(e)$. Let $\psi \in \mathrm{V}_{\gamma}$,

$$
\begin{aligned}
& \int_{s}^{t}\left\langle f\left(\widetilde{u}_{n}(\sigma)\right), P_{n} \psi\right\rangle d s-\int_{0}^{t}\langle f(\widetilde{u}(\sigma), \psi\rangle d \sigma \\
& \quad=\int_{0}^{t}\left\langle f\left(\widetilde{u}_{n}(\sigma)\right)-f(\widetilde{u}(\sigma)), \psi\right\rangle d \sigma+\int_{0}^{t}\left\langle f\left(\widetilde{u}_{n}(\sigma)\right), P_{n} \psi-\psi\right\rangle d \sigma
\end{aligned}
$$

Since $\mathrm{V}_{\gamma} \hookrightarrow \mathrm{H}$, by the Cauchy-Schwarz inequality we have

$$
\begin{aligned}
& \int_{s}^{t}\left\langle f\left(\widetilde{u}_{n}(\sigma)\right), P_{n} \psi\right\rangle d s-\int_{0}^{t}\langle f(\widetilde{u}(\sigma), \psi\rangle d \sigma \\
& \quad \leq \int_{0}^{t}\left\langle f\left(\widetilde{u}_{n}(\sigma)\right)-f(\widetilde{u}(\sigma)), \psi\right\rangle d \sigma+\int_{s}^{t}\left\|f\left(u_{n}(s)\right)\right\|_{\mathrm{V}_{\gamma}^{\prime}}\left\|P_{n} \psi-\psi\right\|_{\mathrm{V}_{\gamma}} d \sigma \\
& \quad \leq \int_{0}^{t}\left\langle f\left(\widetilde{u}_{n}(\sigma)\right)-f(\widetilde{u}(\sigma)), \psi\right\rangle d \sigma+\left\|P_{n} \psi-\psi\right\|_{\mathrm{V}_{\gamma}} \int_{s}^{t}\left(C_{f}\left\|\widetilde{u}_{n}(\sigma)\right\|_{\mathrm{H}}+\left|b_{f}\right|_{L^{1}}\right) d \sigma \\
& \quad:=I_{1}(n)+I_{2}(n)
\end{aligned}
$$

Since $\widetilde{u}_{n} \rightarrow \widetilde{u}$ in $L^{2}\left(0, T ; \mathrm{H}_{l o c}\right)$ and $\widetilde{u}_{n}$ is a bounded sequence in $L^{2}(0, T ; \mathrm{H})$. $I_{1}(n)$ can be shown to converge to zero as $n \rightarrow \infty$ following the methodology of Lemma 5.7 and Corollary 5.8. Since $P_{n} \psi \rightarrow \psi$ in $\mathrm{V}_{\gamma}, I_{2}(n) \rightarrow 0$ as $n \rightarrow \infty$. This completes the proof of Lemma 5.9.

The proofs of Lemmas 5.10, 5.13 and 5.14 follow the similar methodology as that of Lemmas 5.6-5.8 [8] and Lemmas 5.9-5.11 [5].

Let $h$ be the bounded continuous function on $\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$.
Lemma 5.10. Let $\gamma>\frac{3}{2}$. For all $s, t \in[0, T]$, such that $s \leq t$ and all $\psi \in \mathrm{V}_{\gamma}$

$$
\begin{align*}
& \lim _{n \rightarrow \infty} \widetilde{\mathbb{E}}\left[\left\langle\widetilde{M}_{n}(t)-\widetilde{M}_{n}(s), \psi\right\rangle h\left(\widetilde{u}_{n \mid[0, s]}\right)\right] \\
& =\widetilde{\mathbb{E}}\left[\langle\widetilde{M}(t)-\widetilde{M}(s), \psi\rangle h\left(\widetilde{u}_{\mid[0, s]}\right)\right] . \tag{5.50}
\end{align*}
$$

Proof. Let us fix $s, t \in[0, T], s \leq t$ and $\psi \in \mathrm{V}_{\gamma}$. By Eq. (5.39), we have

$$
\begin{aligned}
& \left\langle\widetilde{M}_{n}(t)-\widetilde{M}_{n}(s), \psi\right\rangle=\left\langle\widetilde{u}_{n}(t)-\widetilde{u}_{n}(s), P_{n} \psi\right\rangle+\int_{s}^{t}\left\langle\mathrm{~A} \widetilde{u}_{n}(\sigma), P_{n} \psi\right\rangle d \sigma \\
& +\int_{s}^{t}\left\langle B\left(\widetilde{u}_{n}(\sigma)\right), P_{n} \psi\right\rangle d \sigma+\int_{s}^{t}\left\langle g\left(\left|\widetilde{u}_{n}(\sigma)\right|^{2}\right) \widetilde{u}_{n}(\sigma), P_{n} \psi\right\rangle d \sigma \\
& -\int_{s}^{t}\left\langle f\left(\widetilde{u}_{n}(\sigma)\right), P_{n} \psi\right\rangle d \sigma
\end{aligned}
$$

By Lemma 5.9, we infer that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\langle\widetilde{M}_{n}(t)-\widetilde{M}_{n}(s), \psi\right\rangle=\langle\widetilde{M}(t)-\widetilde{M}(s), \psi\rangle, \quad \widetilde{\mathbb{P}} \text {-a.s. } \tag{5.51}
\end{equation*}
$$

In order to prove (5.50) we first observe that since $\widetilde{u}_{n} \rightarrow \widetilde{u}$ in $\mathcal{Z}_{T}$, in particular in $\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$ and $h$ is a bounded continuous function on $\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$, we get

$$
\begin{equation*}
\lim _{n \rightarrow \infty} h\left(\widetilde{u}_{n \mid[0, s]}\right)=h\left(\widetilde{u}_{[0, s]}\right), \tag{5.52}
\end{equation*}
$$

and

$$
\begin{equation*}
\sup _{n \in \mathbb{N}}\left\|h\left(\widetilde{u}_{n \mid[0, s]}\right)\right\|_{L^{\infty}}<\infty . \tag{5.53}
\end{equation*}
$$

Let us define a sequence of $\mathbb{R}$-valued random variables :

$$
f_{n}(\omega):=\left[\left\langle\widetilde{M}_{n}(t, \omega), \psi\right\rangle-\left\langle\widetilde{M}_{n}(s, \omega), \psi\right\rangle\right] h\left(\widetilde{u}_{n \mid[0, s]}\right), \omega \in \widetilde{\Omega} .
$$

We will prove that the functions $\left\{f_{n}\right\}_{n \in \mathbb{N}}$ are uniformly integrable in order to apply the Vitali's convergence theorem. We claim that

$$
\begin{equation*}
\sup _{n \in \mathbb{N}} \widetilde{\mathbb{E}}\left[\left|f_{n}\right|^{2}\right]<\infty \tag{5.54}
\end{equation*}
$$

Since, $\mathrm{H} \hookrightarrow \mathrm{V}_{\gamma}^{\prime}$ then by the Cauchy-Schwarz inequality, for each $n \in \mathbb{N}$ we have

$$
\begin{equation*}
\widetilde{\mathbb{E}}\left[\left|f_{n}\right|^{2}\right] \leq 2 c\left\|h \circ \widetilde{u}_{n}\right\|_{L^{\infty}}^{2}|\psi|_{\mathrm{V}_{\gamma}}^{2} \widetilde{\mathbb{E}}\left[\left|\widetilde{M}_{n}(t)\right|_{H}^{2}+\left|\widetilde{M}_{n}(s)\right|_{H}^{2}\right] . \tag{5.55}
\end{equation*}
$$

Since, $\widetilde{M}_{n}$ is a continuous martingale with quadratic variation defined in (5.40), by the

Burkholder-Davis-Gundy inequality we obtain

$$
\begin{equation*}
\widetilde{\mathbb{E}}\left[\sup _{t \in[0, T]}\left|\widetilde{M}_{n}(t)\right|_{\mathrm{H}}^{2}\right] \leq c \widetilde{\mathbb{E}}\left[\int_{0}^{T}\left\|G_{n}\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d \sigma\right] \tag{5.56}
\end{equation*}
$$

Since, $P_{n}: \mathrm{H} \rightarrow \mathrm{H}$ is a contraction and by Lemma 2.1, (5.18) for $p=1$, we have

$$
\begin{align*}
& \widetilde{\mathbb{E}}\left[\int_{0}^{T}\left\|G_{n}\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d \sigma\right] \leq \widetilde{\mathbb{E}}\left[\int_{0}^{T}\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d \sigma\right] \\
& \quad \leq \widetilde{\mathbb{E}}\left[\int_{0}^{T} \frac{1}{4}\left|\nabla \widetilde{u}_{n}(\sigma)\right|_{L^{2}}^{2} d \sigma\right] \leq \widetilde{\mathbb{E}}\left[\sup _{\sigma \in[0, T]}\left\|\widetilde{u}_{n}(\sigma)\right\|_{\mathrm{V}}^{2}\right] T<\infty \tag{5.57}
\end{align*}
$$

Then by (5.55) and (5.57) we see that (5.54) holds. Since the sequence $\left\{f_{n}\right\}_{n \in \mathbb{N}}$ is uniformly integrable and by (5.51) it is $\widetilde{\mathbb{P}}$-a.s. point-wise convergent, then application of the Vitali's convergence theorem completes the proof of the Lemma.

Remark 5.11. Using Burkholder-Davis-Gundy inequality we have proved a stronger claim (5.56) than what we needed.

From Lemma 5.5 and Lemma 5.10 we have the following corollary.
Corollary 5.12. For all $s, t \in[0, T]$ such that $s \leq t$ :

$$
\mathbb{E}\left(\widetilde{M}(t)-\widetilde{M}(s) \mid \widetilde{\mathcal{F}}_{t}\right)=0
$$

Lemma 5.13. For all $s, t \in[0, T]$ such that $s \leq t$ and all $\psi, \zeta \in \mathrm{V}_{\gamma}$

$$
\left.\left.\begin{array}{rl}
\lim _{n \rightarrow \infty} & \widetilde{\mathbb{E}}
\end{array}\right]\left(\left\langle\widetilde{M}_{n}(t), \psi\right\rangle\left\langle\widetilde{M}_{n}(t), \zeta\right\rangle-\left\langle\widetilde{M}_{n}(s), \psi\right\rangle\left\langle\widetilde{M}_{n}(s), \zeta\right\rangle\right) h\left(\widetilde{u}_{n \mid[0, s]}\right)\right] .
$$

where $\langle\cdot, \cdot\rangle$ denotes the appropriate duality pairing.

Proof. Let us fix $s, t \in[0, T]$ such that $s \leq t$ and $\psi, \zeta \in \mathrm{V}_{\gamma}$ and define $\mathbb{R}$-valued random variables $f_{n}$ and $f$ for $\omega \in \widetilde{\Omega}$ by
$f_{n}(\omega):=\left(\left\langle\widetilde{M}_{n}(t, \omega), \psi\right\rangle\left\langle\widetilde{M}_{n}(t, \omega), \zeta\right\rangle-\left\langle\widetilde{M}_{n}(s, \omega), \psi\right\rangle\left\langle\widetilde{M}_{n}(s, \omega), \zeta\right\rangle\right) h\left(\widetilde{u}_{n \mid[0, s]}(\omega)\right)$,
$f(\omega):=(\langle\widetilde{M}(t, \omega), \psi\rangle\langle\widetilde{M}(t, \omega), \zeta\rangle-\langle\widetilde{M}(s, \omega), \psi\rangle\langle\widetilde{M}(s, \omega), \zeta\rangle) h\left(\widetilde{u}_{[00, s]}(\omega)\right)$.
By Lemma 5.9 or more precisely by (5.51) and (5.52) we infer that $\lim _{n \rightarrow \infty} f_{n}(\omega)=$ $f(\omega)$, for $\widetilde{\mathbb{P}}$ almost all $\omega \in \widetilde{\Omega}$.
We will prove that the functions $\left\{f_{n}\right\}_{n \in \mathbb{N}}$ are uniformly integrable. We claim that for some $r>1$,

$$
\begin{equation*}
\sup _{n \in \mathbb{N}} \widetilde{\mathbb{E}}\left[\left|f_{n}\right|^{r}\right]<\infty . \tag{5.58}
\end{equation*}
$$

For each $n \in \mathbb{N}$ as before we have

$$
\begin{equation*}
\widetilde{\mathbb{E}}\left[\left|f_{n}\right|^{r}\right] \leq C\left\|h \circ \widetilde{u}_{n}\right\|_{L^{\infty}}^{r}\|\psi\|_{\mathrm{V}_{\gamma}}^{r}\|\zeta\|_{\mathrm{V}_{\gamma}}^{r} \widetilde{\mathbb{E}}\left[\left|\widetilde{M}_{n}(t)\right|_{\mathrm{H}}^{2 r}+\left|\widetilde{M}_{n}(s)\right|_{\mathrm{H}}^{2 r}\right] . \tag{5.59}
\end{equation*}
$$

Since, $\widetilde{M}_{n}$ is a continuous martingale with quadratic variation defined in (5.40), by the Burkholder-Davis-Gundy inequality we obtain

$$
\begin{equation*}
\widetilde{\mathbb{E}}\left[\sup _{t \in[0, T]}\left|\widetilde{M}_{n}(t)\right|_{\mathrm{H}}^{2 r}\right] \leq c \widetilde{\mathbb{E}}\left[\int_{0}^{T}\left\|G_{n}\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d \sigma\right]^{r} \tag{5.60}
\end{equation*}
$$

Since, $P_{n}: \mathrm{H} \rightarrow \mathrm{H}$ is a contraction and by Lemma 2.1 we have

$$
\begin{align*}
& \widetilde{\mathbb{E}}\left[\int_{0}^{T}\left\|G_{n}\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d \sigma\right]^{r} \leq \widetilde{\mathbb{E}}\left[\int_{0}^{T}\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d \sigma\right]^{r} \\
& \quad \leq \widetilde{\mathbb{E}}\left[\int_{0}^{T} \frac{1}{4}\left|\nabla \widetilde{u}_{n}(\sigma)\right|_{L^{2}}^{2} d \sigma\right]^{r} \leq C_{r} T^{r-1} \widetilde{\mathbb{E}}\left[\int_{0}^{T}\left\|\widetilde{u}_{n}(\sigma)\right\|_{\mathrm{V}}^{2 r} d \sigma\right] \\
& \quad \leq C_{r} T^{r} \widetilde{\mathbb{E}}\left[\sup _{\sigma \in[0, T]}\left\|\widetilde{u}_{n}(\sigma)\right\|_{\mathrm{V}}^{2 r}\right] \tag{5.61}
\end{align*}
$$

Thus if $r \in[1,3]$ then by (5.18), (5.53) and (5.59) - (5.61) we infer that (5.58) holds. Hence by application of the Vitali's convergence theorem

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \widetilde{\mathbb{E}}\left[f_{n}\right]=\widetilde{\mathbb{E}}[f] . \tag{5.62}
\end{equation*}
$$

We will be using the following notations in following lemmata. $\mathrm{V}^{\prime}\left(\mathcal{O}_{R}\right)$ is the dual space to $\operatorname{V}\left(\mathcal{O}_{R}\right)$, where

$$
\mathrm{V}\left(\mathcal{O}_{R}\right):=\text { the closure of } \mathcal{V}\left(\mathcal{O}_{R}\right) \text { in } H^{1}\left(\mathcal{O}_{R}, \mathbb{R}^{3}\right)
$$

where

$$
\mathcal{V}\left(\mathcal{O}_{R}\right):=\left\{u \in C_{0}^{\infty}\left(\mathbb{R}^{3} ; \mathbb{R}^{3}\right): \operatorname{div} u=0, \operatorname{supp} u \subset \mathcal{O}_{R}\right\} .
$$

We recall that $\mathrm{H}_{\mathcal{O}_{R}}$ is the space of restrictions to the subset $\mathcal{O}_{R}$ of elements of the space H i.e.,

$$
\mathrm{H}_{\mathcal{O}_{R}}:=\left\{u_{\mid \mathcal{O}_{R}}: u \in \mathrm{H}\right\},
$$

with the scalar product defined by

$$
\langle u, \mathrm{v}\rangle_{\mathrm{H}_{\mathcal{O}_{R}}}:=\int_{\mathcal{O}_{R}} u(x) \mathrm{v}(x) d x, \quad u, \mathrm{v} \in \mathrm{H}_{\mathcal{O}_{R}} .
$$

Lemma 5.14. The map $G: \mathrm{H}_{\mathcal{O}_{R}} \rightarrow \mathcal{L}_{2}\left(\ell^{2} ; \mathrm{V}^{\prime}\left(\mathcal{O}_{R}\right)\right)$ given by (2.13) is well defined and there exists some constant $C_{R}>0$ such that

$$
\begin{equation*}
\|G(u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{V}^{\prime}\left(\mathcal{O}_{R}\right)\right)} \leq C_{R}\|u\|_{\mathrm{H}_{\mathcal{O}_{R}}}, \quad u \in \mathrm{H} . \tag{5.63}
\end{equation*}
$$

Moreover, for every $\psi \in \mathcal{V}$ the mapping $\mathrm{H} \ni u \mapsto\langle G(u), \psi\rangle \in \ell^{2}$ is continuous, if in the space H we consider the Fréchet topology inherited from the space $L_{\text {loc }}^{2}\left(\mathbb{R}^{3}, \mathbb{R}^{3}\right)$.

Proof. Let $\sigma=\left(\sigma^{1}, \ldots, \sigma^{d}\right): \overline{\mathcal{O}} \rightarrow \mathbb{R}^{d}$ and fix $R>0$. Let $u \in \mathcal{V}\left(\mathcal{O}_{R}\right)$. Then

$$
\begin{equation*}
\sum_{j=1}^{d} \frac{\partial}{\partial x_{j}}\left(\sigma^{j} u\right)=\sum_{j=1}^{d}\left(\frac{\partial \sigma^{j}}{\partial x_{j}} u+\sigma^{j} \frac{\partial u}{\partial x_{j}}\right)=(\operatorname{div} \sigma) u+\sum_{j=1}^{d} \sigma^{j} \frac{\partial u}{\partial x_{j}} . \tag{5.64}
\end{equation*}
$$

Let $\mathrm{v} \in \mathcal{V}\left(\mathcal{O}_{R}\right)$. Since, v on the boundary $\partial \mathcal{O}_{R}$ is equal to zero, thus using the integration by parts formula, we obtain for $\mathrm{v} \in \mathcal{V}\left(\mathcal{O}_{R}\right)$

$$
\begin{aligned}
\int_{\mathcal{O}_{R}}\left(\sum_{j=1}^{d} \sigma^{j} \frac{\partial u}{\partial x_{j}}\right) \mathrm{v} d x & =\sum_{j=1}^{d} \int_{\mathcal{O}_{R}} \frac{\partial}{\partial x_{j}}\left(\sigma^{j} u\right) \mathrm{v} d x-\int_{\mathcal{O}_{R}}(\operatorname{div} \sigma) u \mathrm{v} d x \\
& =-\sum_{j=1}^{d} \int_{\mathcal{O}_{R}}\left(\sigma^{j} u\right) \frac{\partial \mathrm{v}}{\partial x_{j}} d x-\int_{\mathcal{O}_{R}}(\operatorname{div} \sigma) u \mathrm{v} d x .
\end{aligned}
$$

Using the Hölder inequality, we obtain

$$
\begin{align*}
& \left|\int_{\mathcal{O}_{R}}\left(\sum_{j=1}^{d} \sigma^{j} \frac{\partial u}{\partial x_{j}}\right) \mathrm{v} d x\right| \\
& \quad \leq\|\sigma\|_{L^{\infty}}|u|_{\mathrm{H}_{\mathcal{O}_{R}}}\|\mathrm{v}\|_{\mathrm{V}\left(\mathcal{O}_{R}\right)}+\|\operatorname{div} \sigma\|_{L^{\infty}}|u|_{\mathrm{H}_{\mathcal{O}_{R}}}\|\mathrm{v}\|_{\mathrm{V}\left(\mathcal{O}_{R}\right)} . \tag{5.65}
\end{align*}
$$

Therefore, if we define a linear functional $\hat{B}_{R}$ by

$$
\hat{B}_{R} \mathrm{~V}:=\int_{\mathcal{O}_{R}}\left(\sum_{j=1}^{d} \sigma^{j} \frac{\partial u}{\partial x_{j}}\right) \mathrm{v} d x, \quad \mathrm{v} \in \mathcal{V}\left(\mathcal{O}_{R}\right)
$$

we infer that it is bounded in the norm of the space $\operatorname{V}\left(\mathcal{O}_{R}\right)$. Thus it can be uniquely extended to a linear bounded functional (denoted also by $\hat{B}_{R}$ ) on $\mathrm{V}\left(\mathcal{O}_{R}\right)$. Moreover, by estimate (5.65) we have the following inequality

$$
\left\|\hat{B}_{R}\right\|_{\mathrm{V}^{\prime}\left(\mathcal{O}_{R}\right)} \leq\left(\|\sigma\|_{L^{\infty}}+\|\operatorname{div} \sigma\|_{L^{\infty}}\right)|u|_{\mathrm{H}_{\mathcal{O}_{R}}}
$$

or equivalently

$$
\begin{equation*}
\|(\sigma \cdot \nabla) u\|_{\mathrm{V}^{\prime}\left(\mathcal{O}_{R}\right)} \leq\left(\|\sigma\|_{L^{\infty}}+\|\operatorname{div} \sigma\|_{L^{\infty}}\right) \cdot|u|_{\mathrm{H}_{\mathcal{O}_{R}}} \tag{5.66}
\end{equation*}
$$

Since by equality (2.13), $G(u)\left(e_{j}\right)=\Pi\left[\left(\sigma_{j} \cdot \nabla\right) u\right]$, where $\left\{e_{j}\right\}_{j=1}^{\infty}$ is an orthonormal basis of $\ell^{2}$, we get by estimate (5.66)

$$
\begin{aligned}
& \|G(u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{V}^{\prime}\left(\mathcal{O}_{R}\right)\right)}=\left[\sum_{j=1}^{\infty}\left\|G(u)\left(e_{j}\right)\right\|_{\mathrm{V}^{\prime}\left(\mathcal{O}_{R}\right)}^{2}\right]^{1 / 2} \\
& \quad \leq\left(\|\sigma\|_{\ell^{2}}+\|\operatorname{div} \sigma\|_{\ell^{2}}\right) \cdot|u|_{\mathrm{H}_{\mathcal{O}_{R}}} .
\end{aligned}
$$

Therefore, using the assumption (H2), $G(u) \in \mathcal{L}_{2}\left(\ell^{2}, \mathrm{~V}^{\prime}\left(\mathcal{O}_{R}\right)\right)$ and

$$
\|G(u)\|_{\mathcal{L}_{2}\left(\ell^{2}, \mathrm{~V}^{\prime}\left(\mathcal{O}_{R}\right)\right)} \leq C_{R} \cdot|u|_{\mathrm{H}_{\mathcal{O}_{R}}} .
$$

By estimate (5.63) and the continuity of the embedding $\mathcal{L}_{2}\left(\ell^{2}, \mathrm{~V}^{\prime}\left(\mathcal{O}_{R}\right)\right) \hookrightarrow$ $\mathcal{L}\left(\ell^{2}, \mathrm{~V}^{\prime}\left(\mathcal{O}_{R}\right)\right)$, we obtain

$$
\|G(u) y\|_{\mathrm{V}^{\prime}\left(\mathcal{O}_{R}\right)} \leq C(R)|u|_{\mathrm{H}_{\mathcal{O}_{R}}}\|y\|_{\ell^{2}}, \quad u \in \mathrm{H}, \quad y \in \ell^{2}
$$

for some constant $C(R)>0$. Thus, for any $\psi \in \mathrm{V}\left(\mathcal{O}_{R}\right)$

$$
\begin{equation*}
|(G(u) y) \psi| \leq C(R)|u|_{\mathrm{H}_{\mathcal{O}_{R}}}\|y\|_{\ell^{2}}\|\psi\|_{\mathrm{V}\left(\mathcal{O}_{R}\right)}, \quad u \in \mathrm{H}, \quad y \in \ell^{2} . \tag{5.67}
\end{equation*}
$$

Now we identify ${ }_{\mathrm{V}^{\prime}}\langle G(\cdot), \psi\rangle_{\mathrm{V}}$ with the mapping $\psi^{* *} G: \mathrm{H} \rightarrow\left(\ell^{2}\right)^{\prime}$ defined by

$$
\left(\psi^{* *} G(u)\right) y:=(G(u) y) \psi \in \mathbb{R}, \quad u \in \mathrm{H}, \quad y \in \ell^{2}
$$

Thus, from the inequality (5.67), we infer that

$$
\begin{equation*}
\left\|\psi^{* *} G(u)\right\|_{\ell^{2}} \leq C(R)\|\psi\|_{\mathrm{V}}|u|_{\mathrm{H}_{\mathcal{O}_{R}}} \tag{5.68}
\end{equation*}
$$

Therefore, if we fix $\psi \in \mathcal{V}$ then, there exists $R_{0}>0$ such that $\operatorname{supp} \psi$ is a compact subset of $\mathcal{O}_{R_{0}}$. Since $G$ is linear, estimate (5.68) with $R:=R_{0}$ yields that the mapping

$$
L_{l o c}^{2}\left(\mathbb{R}^{3}, \mathbb{R}^{3}\right) \supset \mathrm{H} \ni u \mapsto \psi^{* *} G(u) \in \ell^{2}
$$

is continuous in the Fréchet topology inherited on the space $H$ from the space $L_{l o c}^{2}\left(\mathbb{R}^{3}, \mathbb{R}^{3}\right)$, concluding the proof of the lemma.

Lemma 5.15 (Convergence of quadratic variations). For any $s, t \in[0, T]$ and $\psi, \zeta \in \mathrm{V}_{\gamma}$, we have

$$
\left.\left.\begin{array}{rl}
\lim _{n \rightarrow \infty} & \widetilde{\mathbb{E}}
\end{array}\right]\left(\int_{s}^{t}\left\langle\left(G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right)^{*} P_{n} \psi,\left(G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right)^{*} P_{n} \zeta\right\rangle d \sigma\right) \cdot h\left(\widetilde{u}_{n \mid[0, s]}\right)\right] \text {. }
$$

where $\langle\cdot, \cdot\rangle$ is the inner product in $\ell^{2}$.
Proof. Let us fix $\psi, \zeta \in \mathrm{V}_{\gamma}$ and let us denote for $\omega \in \widetilde{\Omega}$

$$
f_{n}(\omega):=\left(\int_{s}^{t}\left\langle\left(G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right)^{*} P_{n} \psi,\left(G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right)^{*} P_{n} \zeta\right\rangle_{\ell^{2}} d \sigma\right) \cdot h\left(\widetilde{u}_{n \mid[0, s]}\right) .
$$

We will prove that the functions are uniformly integrable and convergent $\widetilde{\mathbb{P}}$-a.s. We start by proving that for some $r>1$,

$$
\begin{equation*}
\sup _{n \in \mathbb{N}} \widetilde{\mathbb{E}}\left[\left|f_{n}\right|^{r}\right]<\infty \tag{5.69}
\end{equation*}
$$

Since, $\mathcal{L}_{2}\left(\ell^{2} ; H\right)$ is continuously embbeded in $\mathcal{L}\left(\ell^{2} ; H\right)$, then by (2.20) there exists some $c>0$ such that

$$
\begin{aligned}
\left|\left(G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)\right)^{*} P_{n} \psi\right|_{\ell^{2}} & \leq\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)\right\|_{\mathcal{L}\left(\ell^{2} ; \mathrm{H}\right)}\left|P_{n} \psi\right|_{\mathrm{H}} \\
& \leq \frac{c}{2}\left|\nabla \widetilde{u}_{n}(\sigma, \omega)\right|_{L^{2}}|\psi|_{\mathrm{H}}
\end{aligned}
$$

and thus

$$
\begin{aligned}
& \mathbb{E}\left|f_{n}\right|^{r}=\mathbb{E}\left|\left(\int_{s}^{t}\left\langle\left(G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right)^{*} P_{n} \psi,\left(G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right)^{*} P_{n} \zeta\right\rangle_{\ell^{2}} d \sigma\right) \cdot h\left(\widetilde{u}_{n \mid[0, s]}\right)\right|^{r} \\
& \leq\left\|h \circ \widetilde{u}_{n}\right\|_{L^{\infty}}^{r} \mathbb{E}\left(\int_{s}^{t}\left|\left(G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)\right)^{*} P_{n} \psi\right|_{\ell^{2}}\left|\left(G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)\right)^{*} P_{n} \zeta\right|_{\ell^{2}} d \sigma\right)^{r} \\
& \leq \frac{c^{2 r}}{4^{r}}\left\|h \circ \widetilde{u}_{n}\right\|_{L^{\infty}}^{r}|\psi|_{\mathrm{H}}^{r}|\zeta|_{\mathrm{H}}^{r} \mathbb{E}\left(\int_{s}^{t}\left\|\widetilde{u}_{n}(\sigma, \omega)\right\|_{\mathrm{V}}^{2} d \sigma\right)^{r} .
\end{aligned}
$$

Using the Hölder inequality, we get

$$
\begin{aligned}
& \mathbb{E}\left(\int_{s}^{t}\left\|\widetilde{u}_{n}(\sigma, \omega)\right\|_{\mathrm{V}}^{2} d \sigma\right)^{r} \leq(t-s)^{r-1} \mathbb{E} \int_{s}^{t}\left\|\widetilde{u}_{n}(\sigma, \omega)\right\|_{\mathrm{V}}^{2 r} d \sigma \\
& \\
& \leq T^{r} \mathbb{E}\left(\sup _{\sigma \in[0, T]}\left\|\widetilde{u}_{n}(\sigma, \omega)\right\|_{\mathrm{V}}^{2 r}\right) .
\end{aligned}
$$

Thus

$$
\mathbb{E}\left|f_{n}\right|^{r} \leq \widetilde{C} \mathbb{E}\left(\sup _{\sigma \in[0, T]}\left\|\widetilde{u}_{n}(\sigma, \omega)\right\|_{\mathrm{V}}^{2 r}\right)
$$

for some $\widetilde{C}>0$. Hence by (5.34) for some $r \in(1,3]$

$$
\sup _{n \in \mathbb{N}} \widetilde{\mathbb{E}}\left|f_{n}\right|^{r} \leq \widetilde{C} \sup _{n \in \mathbb{N}} \widetilde{\mathbb{E}}\left[\sup _{\sigma \in[0, T]}\left\|\widetilde{u}_{n}(\sigma, \omega)\right\|_{\mathrm{V}}^{2 r}\right] \leq \widetilde{C} C_{1}(r)<\infty
$$

inferring (5.69).
Pointwise convergence : Next, we have to prove the following pointwise convergence for a fix $\omega \in \widetilde{\Omega}$, i.e. we will show that for a fix $\omega \in \widetilde{\Omega}$

$$
\begin{gather*}
\lim _{n \rightarrow \infty} \int_{s}^{t}\left\langle\left(G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right)^{*} P_{n} \psi,\left(G\left(\sigma, \widetilde{u}_{n}(\sigma)\right)\right)^{*} P_{n} \zeta\right\rangle_{\ell^{2}} d \sigma \\
=\int_{s}^{t}\left\langle(G(\sigma, \widetilde{u}(\sigma)))^{*} \psi,\left(G(\sigma, \widetilde{u}(\sigma))^{*} \zeta\right\rangle_{\ell^{2}} d \sigma\right. \tag{5.70}
\end{gather*}
$$

Let us fix $\omega \in \widetilde{\Omega}$ such that
(i) $\widetilde{u}_{n}(\cdot, \omega) \rightarrow \widetilde{u}(\cdot, \omega)$ in $L^{2}\left(0, T, H_{l o c}\right)$,
(ii) $\widetilde{u}(\cdot, \omega) \in L^{2}(0, T ; H)$ and the sequence $\left(\widetilde{u}_{n}(\cdot, \omega)\right)_{n \in \mathbb{N}}$ is bounded in $\mathcal{C}([0, T] ; \mathrm{V})$.

Notice that, in order to prove (5.70) it is sufficient to prove that

$$
\begin{equation*}
G\left(\cdot, \widetilde{u}_{n}(\cdot, \omega)\right)^{*} P_{n} \psi \rightarrow G(\cdot, \widetilde{u}(\cdot, \omega))^{*} \psi \quad \text { in } \quad L^{2}\left(s, t ; \ell^{2}\right) . \tag{5.71}
\end{equation*}
$$

We have

$$
\begin{align*}
& \int_{s}^{t}\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*} P_{n} \psi-G(\sigma, \widetilde{u}(\sigma, \omega))^{*} \psi\right\|_{\ell^{2}}^{2} d \sigma \\
& \leq \int_{s}^{t}\left(\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*}\left(P_{n} \psi-\psi\right)\right\|_{\ell^{2}}\right. \\
&\left.\quad+\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*} \psi-G(\sigma, \widetilde{u}(\sigma, \omega))^{*} \psi\right\|_{\ell^{2}}\right)^{2} d \sigma \\
& \leq 2 \int_{s}^{t}\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*}\right\|_{\mathcal{L}\left(\mathrm{H}, \ell^{2}\right)}^{2} \cdot\left|P_{n} \psi-\psi\right|_{\mathrm{H}}^{2} d \sigma \\
&+2 \int_{s}^{t}\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*} \psi-G(\sigma, \widetilde{u}(\sigma, \omega))^{*} \psi\right\|_{\ell^{2}}^{2} d \sigma \\
&= 2\left\{I_{1}(n)+I_{2}(n)\right\} . \tag{5.72}
\end{align*}
$$

Let us consider the term $I_{1}(n)$. Since $\psi \in \mathrm{V}_{\gamma}$, we have

$$
\lim _{n \rightarrow \infty}\left|P_{n} \psi-\psi\right|_{\mathrm{H}}=0
$$

By Lemma 2.1, the continuity of the embedding $\mathcal{L}_{2}\left(\ell^{2}, \mathrm{H}\right) \hookrightarrow \mathcal{L}\left(\ell^{2}, \mathrm{H}\right)$ and (ii), we infer that

$$
\begin{aligned}
\int_{s}^{t}\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*}\right\|_{\mathcal{L}\left(\mathrm{H}, \ell^{2}\right)}^{2} d \sigma & \leq C \int_{s}^{t}\left|\nabla \widetilde{u}_{n}(\sigma, \omega)\right|_{L^{2}}^{2} d \sigma \\
& \leq \widetilde{C} T \sup _{n \in \mathbb{N}}\left\|\widetilde{u}_{n}(\omega)\right\|_{\mathcal{C}([0, T] ; \mathrm{V})} \leq K
\end{aligned}
$$

for some constant $K>0$. Thus

$$
\lim _{n \rightarrow \infty} I_{1}(n)=\lim _{n \rightarrow \infty} \int_{s}^{t}\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*}\right\|_{\mathcal{L}\left(\mathrm{H}, \ell^{2}\right)}^{2} \cdot\left|P_{n} \psi-\psi\right|_{\mathrm{H}}^{2} d \sigma=0
$$

Let us move to the term $I_{2}(n)$ in (5.72). We will prove that for every $\psi \in \mathrm{V}_{\gamma}$ the term $I_{2}(n)$ tends to zero as $n \rightarrow \infty$. Assume first that $\psi \in \mathcal{V}$. Then there exists $R>0$ such that $\operatorname{supp} \psi$ is a compact subset of $\mathcal{O}_{R}$. Since $\widetilde{u}_{n}(\cdot, \omega) \rightarrow \widetilde{u}(\cdot, \omega)$ in $L^{2}\left(0, T ; H_{l o c}\right)$, then in particular

$$
\lim _{n \rightarrow \infty} q_{T, R}\left(\widetilde{u}_{n}(\cdot, \omega)-\widetilde{u}(\cdot, \omega)\right)=0
$$

where $q_{T, R}$ is the seminorm defined by (3.1). In other words, $\widetilde{u}_{n}(\cdot, \omega) \rightarrow \widetilde{u}(\cdot, \omega)$ in $L^{2}\left(0, T ; H_{\mathcal{O}_{R}}\right)$. Therefore, there exists a subsequence $\left(\widetilde{u}_{n_{k}}(\cdot, \omega)\right)_{k}$ such that

$$
\widetilde{u}_{n_{k}}(\sigma, \omega) \rightarrow \widetilde{u}(\sigma, \omega) \quad \text { in } H_{\mathcal{O}_{R}} \text { for almost all } \sigma \in[0, T] \text { as } k \rightarrow \infty .
$$

Hence by Lemma 5.14 as $k \rightarrow \infty$

$$
G\left(\sigma, \widetilde{u}_{n_{k}}(\sigma, \omega)\right)^{*} \psi \rightarrow G(\sigma, \widetilde{u}(\sigma, \omega))^{*} \psi \text { in } \ell^{2} \text { for almost all } \sigma \in[0, T]
$$

In conclusion, by the Vitali's convergence theorem

$$
\lim _{k \rightarrow \infty} \int_{s}^{t}\left\|G\left(\widetilde{u}_{n_{k}}(\sigma, \omega)\right)^{*} \psi-G(\widetilde{u}(\sigma, \omega))^{*} \psi\right\|_{\ell^{2}}^{2} d \sigma=0 \quad \text { for } \psi \in \mathcal{V}
$$

Repeating the above reasoning for all subsequences, we infer that from every subsequence of the sequence $\left(G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*} \psi\right)_{n}$ we can choose the subsequence convergent in $L^{2}\left(s, t ; \ell^{2}\right)$ to the same limit. Thus, the whole sequence $\left(G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*} \psi\right)_{n}$ is convergent to $G(\sigma, \widetilde{u}(\sigma, \omega))^{*} \psi$ in $L^{2}\left(s, t ; \ell^{2}\right)$. At the same time

$$
\lim _{n \rightarrow \infty} I_{2}(n)=0 \quad \text { for every } \psi \in \mathcal{V}
$$

If $\psi \in \mathrm{V}_{\gamma}$ then for every $\varepsilon>0$ we can find $\psi_{\varepsilon} \in \mathcal{V}$ such that $\left\|\psi-\psi_{\varepsilon}\right\|_{V_{\gamma}}<$ $\varepsilon$. By the continuity of embeddings $\mathcal{L}_{2}\left(\ell^{2}, \mathrm{H}\right) \hookrightarrow \mathcal{L}\left(\ell^{2}, \mathrm{H}\right) \hookrightarrow \mathcal{L}\left(\ell^{2}, \mathrm{~V}_{\gamma}^{\prime}\right)$, Lemma 2.1 and (ii), we obtain

$$
\begin{array}{rl}
\int_{s}^{t}\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*} \psi-G(\sigma, \widetilde{u}(\sigma, \omega))^{*} \psi\right\|_{\ell^{2}}^{2} d \sigma \\
\leq & 2 \int_{s}^{t}\left\|\left[G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*}-G(\sigma, \widetilde{u}(\sigma, \omega))^{*}\right]\left(\psi-\psi_{\varepsilon}\right)\right\|_{\ell^{2}}^{2} d \sigma \\
& +2 \int_{s}^{t}\left\|\left[G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*}-G(\widetilde{u}(\sigma, \omega))^{*}\right] \psi_{\varepsilon}\right\|_{\ell^{2}}^{2} d \sigma \\
\leq & 4 \int_{s}^{t}\left[\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)\right\|_{\mathcal{L}\left(\ell^{2}, \mathrm{~V}_{\gamma}^{\prime}\right)}^{2}+\|G(\sigma, \widetilde{u}(\sigma, \omega))\|_{\mathcal{L}\left(\ell^{2}, \mathrm{~V}_{\gamma}^{\prime}\right)}^{2}\right]\left\|\psi-\psi_{\varepsilon}\right\|_{\mathrm{V}_{\gamma}}^{2} d \sigma \\
& +2 \int_{s}^{t}\left\|\left[G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*}-G(\sigma, \widetilde{u}(\sigma, \omega))^{*}\right] \psi_{\varepsilon}\right\|_{\ell^{2}}^{2} d \sigma \\
\leq c & T\left(\left\|\widetilde{u}_{n}(\cdot, \omega)\right\|_{\mathcal{C}(0, T ; \mathrm{V})}^{2}+\|\widetilde{u}(\cdot, \omega)\|_{\mathcal{C}(0, T ; \mathrm{V})}^{2}\right) \cdot \varepsilon^{2} \\
& +2 \int_{s}^{t}\left\|\left[G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*}-G(\sigma, \widetilde{u}(\sigma, \omega))^{*}\right] \psi_{\varepsilon}\right\|_{\ell^{2}}^{2} d \sigma \\
\leq & C \varepsilon^{2}+2 \int_{s}^{t}\left\|\left[G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*}-G(\sigma, \widetilde{u}(\sigma, \omega))^{*}\right] \psi_{\varepsilon}\right\|_{\ell^{2}}^{2} d \sigma
\end{array}
$$

for some positive constants $c$ and $C$. Passing to the upper limit as $n \rightarrow \infty$, we infer that

$$
\limsup _{n \rightarrow \infty} \int_{s}^{t}\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*} \psi-G(\sigma, \widetilde{u}(\sigma, \omega))^{*} \psi\right\|_{\ell^{2}}^{2} d \sigma \leq C \varepsilon^{2}
$$

In conclusion, we proved that

$$
\lim _{n \rightarrow \infty} \int_{s}^{t}\left\|G\left(\sigma, \widetilde{u}_{n}(\sigma, \omega)\right)^{*} \psi-G(\sigma, \widetilde{u}(\sigma, \omega))^{*} \psi\right\|_{\ell^{2}}^{2} d \sigma=0
$$

which completes the proof of (5.71). Thus, by (5.69), convergence (5.70) and the Vitali's convergence theorem, we conclude the proof of Lemma 5.15.

By Lemma 5.10 we can pass to the limit in (5.41). By Lemmas 5.13 and 5.15 we can pass to the limit in (5.42) as well. After passing to the limits
we infer that for all $\psi, \zeta \in \mathrm{V}_{\gamma}$ and all bounded continuous functions $h$ on $\mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$ :

$$
\begin{equation*}
\widetilde{\mathbb{E}}\left[\langle\widetilde{M}(t)-\widetilde{M}(s), \psi\rangle h\left(\widetilde{u}_{\mid[0, s]}\right)\right]=0 \tag{5.73}
\end{equation*}
$$

and

$$
\begin{align*}
\widetilde{\mathbb{E}}[ & (\langle\widetilde{M}(t), \psi\rangle\langle\widetilde{M}(t), \zeta\rangle-\langle\widetilde{M}(s), \psi\rangle\langle\widetilde{M}(s), \zeta\rangle \\
& \left.\left.-\int_{s}^{t}\left\langle(G(r, \widetilde{u}(r)))^{*} \psi,(G(r, \widetilde{u}(r)))^{*} \zeta\right\rangle_{\ell^{2}} d r\right) \cdot h\left(\widetilde{u}_{\mid[0, s]}\right)\right]=0 \tag{5.74}
\end{align*}
$$

where $\langle\cdot, \cdot\rangle$ is the dual pairing between $\mathrm{V}_{\gamma}^{\prime}$ and $\mathrm{V}_{\gamma}$.
From Lemma 5.5, Lemma 5.13 and Lemma 5.15, we infer the following corollary.

Corollary 5.16. For $t \in[0, T]$

$$
\langle\langle\widetilde{M}\rangle\rangle_{t}=\int_{0}^{t}\|G(s, \widetilde{u}(s))\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)} d s, \quad t \in[0, T]
$$

Continuation of the proof of Theorem 5.4. Now we apply the idea analogous to that used by Da Prato and Zabczyk, see [13, Section 8.3]. By Lemma 5.6, and Corollary 5.12 , we infer that $\widetilde{M}(t), t \in[0, T]$ is an H-valued continuous square integrable martingale with respect to the filtration $\widetilde{\mathbb{F}}=\left(\widetilde{\mathcal{F}}_{t}\right)$. Moreover, by Corollary 5.16 the quadratic variation of $\widetilde{M}$ is given by

$$
\begin{equation*}
\langle\langle\widetilde{M}\rangle\rangle_{t}=\int_{0}^{t}\|G(s, \widetilde{u}(s))\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)} d s \tag{5.75}
\end{equation*}
$$

Therefore by the martingale representation theorem, there exist

- a stochastic basis $(\widetilde{\widetilde{\Omega}}, \widetilde{\widetilde{F}}, \widetilde{\widetilde{F}}, \widetilde{\mathbb{P}})$,
- a cylindrical Wiener process $\widetilde{\widetilde{W}}(t)$,
- and a progressively measurable process $\widetilde{\widetilde{u}}(t)$ such that for all $t \in[0, T]$ and all $\mathrm{v} \in \mathcal{V}$

$$
\begin{aligned}
& \langle\widetilde{\widetilde{u}}(t), \mathrm{v}\rangle-\langle\widetilde{\widetilde{u}}(0), \mathrm{v}\rangle+\int_{0}^{t}\langle\mathrm{~A} \widetilde{\widetilde{u}}(s), \mathrm{v}\rangle d s+\int_{0}^{t}\langle B(\widetilde{\widetilde{u}}(s), \widetilde{\widetilde{u}}(s)), \mathrm{v}\rangle d s \\
& \quad=\int_{0}^{t}\left\langle f(\widetilde{\widetilde{u}}(s))-g\left(|\widetilde{\widetilde{u}}(s)|^{2}\right) \widetilde{\widetilde{u}}(s), \mathrm{v}\right\rangle d s+\left\langle\int_{0}^{t} G(s, \widetilde{\widetilde{u}}(s)) d \widetilde{\widetilde{W}}(s), \mathrm{v}\right\rangle
\end{aligned}
$$

Thus, the conditions from Definition 3.13 hold with $(\widehat{\Omega}, \widehat{\mathcal{F}}, \widehat{\mathbb{F}}, \widehat{\mathbb{P}})=(\widetilde{\widetilde{\Omega}}, \widetilde{\widetilde{\mathcal{F}}}, \widetilde{\widetilde{\mathbb{F}}}, \widetilde{\mathbb{P}})$, $\widehat{W}=\widetilde{W}$ and $\widehat{u}=\widetilde{\widetilde{u}}$. The proof of Theorem 5.4 is thus complete.

### 5.4. Uniqueness and strong solutions

In this subsection we will show that the solutions of (2.17) are pathwise unique and that the martingale solution of (2.17) is the strong solution. Let us recall the definition of pathwise unique solutions.

Definition 5.17. Let $\left(\Omega, \mathcal{F}, \mathbb{F}, \mathbb{P}, W, u^{i}\right), i=1,2$ be the martingale solutions of (2.17) with $u^{i}(0)=u_{0}, i=1,2$. Then we say that the solutions are pathwise unique if $\mathbb{P}$-a.s. for all $t \in[0, T], u^{1}(t)=u^{2}(t)$.

Theorem 5.18. Assume that the assumptions (H1) and (H2) are satisfied. If $u_{1}, u_{2}$ are two solutions of (2.17) defined on the same filtered probability space $(\widehat{\Omega}, \widehat{\mathcal{F}}, \widehat{\mathbb{F}}, \widehat{\mathbb{P}})$ then $\widehat{\mathbb{P}}$-a.s. for all $t \in[0, T], u_{1}(t)=u_{2}(t)$.

This theorem has been proved in [31, Theorem 3.7].
Theorem 5.19. Assume that assumptions (H1) and (H2) are satisfied. Then there exists a path-wise unique strong solution $u \in \mathcal{C}([0, T] ; \mathrm{V}) \cap L^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ of (2.17) such that

$$
\sup _{t \in[0, T]}\|u(t)\|_{\mathrm{V}}^{2}+\int_{0}^{T}|u(t)|_{\mathrm{D}(\mathrm{~A})}^{2} d t<\infty
$$

Proof. Since by Theorem 5.4 there exists a martingale solution and by Theorem 5.18 it is pathwise unique, the existence of strong solution follows from [28, Theorem 2]. Moreover, it can be shown that $u \in \mathcal{C}([0, T] ; \mathrm{V}) \cap$ $L^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ by following the proof of [5, Lemma 3.6].

## 6. Invariant measures

In this section, we consider time homogeneous damped tamed NSEs, i.e. the coefficients $f, \sigma$ are independent of $t$ and furthermore $f \in \mathrm{H}$ is not dependent on $u$. The time homogeneous damped tamed NSEs in abstract form are given by

$$
\begin{align*}
d u(t)= & \left.-\mathrm{A}_{\alpha} u(t)-B(u(t))-\Pi\left[g\left(|u(t)|^{2}\right) u(t)\right]+\Pi f\right] d t \\
& +\sum_{j=1}^{\infty} G_{j}(u(t)) d W_{t}^{j}  \tag{6.1}\\
u(0)= & u_{0} \in \mathrm{~V}
\end{align*}
$$

where $\mathrm{A}_{\alpha}=\alpha I-\nu \Delta$ for some $\alpha \in \mathbb{R}$ and $\nu>0$ is the viscosity. The operator $B$ and the cylindrical Wiener process $W=\left(W_{j}\right)_{j=1}^{\infty}$ on $\ell^{2}$ is same as defined in Section 2 and $G_{j}$ are as defined in (2.12).

Let $\mathcal{B}_{b}(\mathrm{~V})$ denote the set of all bounded and Borel measurable functions on V . For any $\varphi \in \mathcal{B}_{b}(\mathrm{~V}), t \geq 0$, we define a function $T_{t} \varphi: \mathrm{V} \rightarrow \mathbb{R}$ by

$$
\begin{equation*}
T_{t} \varphi(\mathrm{v}):=\mathbb{E}(\varphi(u(t ; \mathrm{v}))), \quad \mathrm{v} \in \mathrm{~V} \tag{6.2}
\end{equation*}
$$

It follows from Theorem 6.2 and Ondrejat [29] (see also [6]) that $T_{t} \varphi \in \mathcal{B}_{b}(\mathrm{~V})$ and $\left\{T_{t}\right\}_{t \geq 0}$ is a semigroup on $\mathcal{B}_{b}(\mathrm{~V})$. Also since this unique solution to (6.1) has $\bar{a} . e$. path in $\mathcal{C}([0, T] ; \mathrm{V})$, it is also a Markov semigroup (see [29, Theorem 27]). Moreover, $\left\{T_{t}\right\}_{t \geq 0}$ is a Feller semigroup, i.e. $T_{t}$ maps $C_{b}(\mathrm{~V})$ into itself.

Next we state the main result of this section, regarding the existence of an invariant measure.

Theorem 6.1. Let for every $\alpha>0$, the assumptions $\mathbf{( H 1})^{\prime}-(\mathbf{H} 3)^{\prime}$ be satisfied. Then there exists an invariant measure $\mu \in \mathcal{P}(\mathrm{V})$ of the semigroup $\left(T_{t}\right)_{t \geq 0}$ defined by (6.2), such that for any $t \geq 0$ and $\varphi \in \operatorname{SC}_{b}\left(\mathrm{~V}_{w}\right)$

$$
\int_{\mathrm{V}} T_{t} \varphi(u) \mu(d u)=\int_{\mathrm{V}} \varphi(u) \mu(d u)
$$

If $T_{t}$ is sequentially weakly Feller Markov semigroup then for every $\varphi \in \mathrm{SC}_{b}\left(\mathrm{~V}_{w}\right), T_{t} \varphi \in \mathrm{SC}_{b}\left(\mathrm{~V}_{w}\right) \subset B_{b}(\mathrm{~V})$ (see [6, 23] for the definitions and inclusion of the spaces); therefore the integral on the l.h.s. in Theorem 6.1 makes sense.

Next we list the assumptions that we make on the coefficients $f$ and $\sigma$ along with a coercivity type assumption, see [30].
$(\mathbf{H} 1)^{\prime}$ The function $f: \mathbb{R}^{3} \rightarrow \mathbb{R}^{3}$ is time independent and H -valued.
$(\mathbf{H} 2)^{\prime}$ A measurable function $\sigma: \mathbb{R}^{3} \rightarrow \ell^{2}$ of $C^{1}$ class with respect to the $x$-variable and for all $x \in \mathbb{R}^{3}$ there exists a constant $C_{\sigma}>0$ such that

$$
\left\|\partial_{x^{j}} \sigma(x)\right\|_{\ell^{2}} \leq C_{\sigma}, \quad j=1,2,3
$$

and, for all $x \in \mathbb{R}^{3}$,

$$
\|\sigma(x)\|_{\ell^{2}}^{2} \leq \frac{1}{4}
$$

$(\mathbf{H} 3)^{\prime}$ there exists a $\delta>0$ such that

$$
2 \nu|\nabla u|_{L^{2}}^{2}-\|G(u)\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} \geq 2 \delta|\nabla u|_{L^{2}}^{2}, \quad u \in \mathrm{~V}
$$

The following theorem regarding the existence of a pathwise unique strong solution to the time homogeneous damped tamed NSEs (6.1) can be proved by modifying the proofs of Theorem 5.4 and Theorem 5.18 to incorporate the extra linear term $\alpha u$.

Theorem 6.2. Assume that assumptions $(\mathbf{H} 1)^{\prime}$ and $(\mathbf{H} 2)^{\prime}$ are satisfied. Then for every $u_{0} \in \mathrm{~V}$, there exists a path-wise unique strong solution $u$ of (6.1) for every $T>0$ such that $u \in \mathcal{C}([0, T] ; \mathrm{V}) \cap L^{2}(0, T ; \mathrm{D}(\mathrm{A})), \mathbb{P}$-a.s.

For fixed initial value $u_{0}=\mathrm{v} \in \mathrm{V}$ we denote the (path-wise) unique solution of (6.1), whose existence is proved in Theorem 6.2 by $u(t ; \mathrm{v})$.
Definition 6.3. We say that a family $\left\{T_{t}\right\}_{t \geq 0}$ is sequentially weakly Feller iff

$$
T_{t}: \mathrm{SC}_{b}\left(\mathrm{~V}_{w}\right) \rightarrow \mathrm{SC}_{b}\left(\mathrm{~V}_{w}\right), \quad t \geq 0
$$

For a metric space $\mathbb{U}$, we use $\mathcal{P}(\mathbb{U})$ to denote the family of all Borel probability measures on $\mathbb{U}$. We will use the following theorem from MaslowskiSeidler [23] to prove the existence of invariant measures.
Theorem 6.4. Assume that
(i) the semigroup $\left\{T_{t}\right\}_{t \geq 0}$, defined by (6.2) is sequentially weakly Feller in V,
(ii) for any $\varepsilon>0$ there exists $R>0$ such that

$$
\sup _{T \geq 1} \frac{1}{T} \int_{0}^{T} \mathbb{P}\left(\left\{\left\|u\left(t ; u_{0}\right)\right\|_{\mathrm{V}}>R\right\}\right) d t<\varepsilon
$$

Then there exists at least one invariant measure for (6.1).

### 6.1. Boundedness in probability

Lemma 6.5. Let $u_{0} \in \mathrm{~V}$. Then, under the assumptions of Theorem 6.1, for every $\varepsilon>0$, there exists $R>0$ such that

$$
\begin{equation*}
\sup _{T \geq 1} \frac{1}{T} \int_{0}^{T} \mathbb{P}\left(\left\{\left\|u\left(t ; u_{0}\right)\right\|_{\mathrm{V}}>R\right\}\right) d t<\varepsilon \tag{6.3}
\end{equation*}
$$

Proof. Using the Itô formula for the function $\phi(\xi)=|\xi|_{\mathrm{H}}^{2}$ and the process $u(t)$, we have

$$
\begin{align*}
\frac{1}{2}|u(t)|_{\mathrm{H}}^{2} & =\frac{1}{2}\left|u_{0}\right|_{\mathrm{H}}^{2}+\int_{0}^{t}\left\langle-\mathrm{A}_{\alpha} u(s)-B(u(s))-\Pi\left(g\left(|u(s)|^{2}\right) u(s)\right), u(s)\right\rangle_{\mathrm{H}} d s \\
& +\int_{0}^{t}\langle\Pi f, u(s)\rangle_{\mathrm{H}} d s+\int_{0}^{t} \sum_{j=1}^{\infty}\left\langle G_{j}(u(s)) d W_{s}^{j}, u(s)\right\rangle_{\mathrm{H}} \\
& +\frac{1}{2} \int_{0}^{t}\|G(u(s))\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d s \tag{6.4}
\end{align*}
$$

Now we deal with each term on the r.h.s. of (6.4) one by one. Firstly let us notice that we have

$$
\begin{gather*}
\left\langle\mathrm{A}_{\alpha} u, u\right\rangle_{\mathrm{H}}=\alpha|u|_{\mathrm{H}}^{2}+\nu|\nabla u|_{L^{2}}^{2},  \tag{6.5}\\
\langle B(u), u\rangle_{\mathrm{H}}=0,  \tag{6.6}\\
\left\langle\Pi\left(g\left(|u|^{2}\right) u\right), u\right\rangle_{\mathrm{H}}=\left|\left|\sqrt{g\left(|u|^{2}\right) \mid} \cdot\right| u\right|_{L^{2}}^{2} \tag{6.7}
\end{gather*}
$$

Using the assumptions on $f$, for any $\beta>0$ we obtain the following estimate

$$
\begin{equation*}
\langle\Pi f, u\rangle_{\mathrm{H}} \leq\|f\|_{\mathrm{H}}\|u\|_{\mathrm{H}} \leq \frac{1}{4 \beta}|f|_{\mathrm{H}}^{2}+\beta|u|_{\mathrm{H}}^{2} \tag{6.8}
\end{equation*}
$$

Since $u$ is the solution of (6.1) and satisfies the estimates (4.24) (courtsey, Theorem 6.2), we can show that the process

$$
M(t)=\int_{0}^{t}\left\langle u(s), \sum_{j=1}^{\infty} G_{j}(u(s)) d W_{s}^{j}\right\rangle_{\mathrm{H}}
$$

is a martingale. Thus, taking expectation in (6.4) and using the estimates (6.5) - (6.8), we infer

$$
\begin{aligned}
\frac{1}{2} \mathbb{E}|u(t)|_{\mathrm{H}}^{2} & \leq \frac{1}{2}\left|u_{0}\right|_{\mathrm{H}}^{2}-\alpha \mathbb{E} \int_{0}^{t}|u(s)|_{\mathrm{H}}^{2} d s-\nu \mathbb{E} \int_{0}^{t}|\nabla u(s)|_{L^{2}}^{2} d s \\
& -\mathbb{E} \int_{0}^{t}| | \sqrt{g\left(|u(s)|^{2}\right) \mid} \cdot|u(s)|_{L^{2}}^{2} d s+\frac{1}{4 \beta} \mathbb{E} \int_{0}^{t}|f|_{\mathrm{H}}^{2} d s \\
& +\beta \mathbb{E} \int_{0}^{t}|u(s)|_{\mathrm{H}}^{2} d s+\frac{1}{2} \int_{0}^{t}\|G(u(s))\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2} d s .
\end{aligned}
$$

On rearranging, we get

$$
\frac{1}{2} \mathbb{E}|u(t)|_{\mathrm{H}}^{2}+\frac{1}{2} \mathbb{E} \int_{0}^{t}\left(2 \nu|\nabla u(s)|_{L^{2}}^{2}-\|G(u(s))\|_{\mathcal{L}_{2}\left(\ell^{2} ; \mathrm{H}\right)}^{2}\right) d s
$$

$$
\begin{align*}
& +\left.\mathbb{E} \int_{0}^{t}| | \sqrt{g\left(|u(s)|^{2}\right)}|\cdot| u(s)\right|_{L^{2}} ^{2} d s \\
\leq & \frac{1}{2}\left|u_{0}\right|_{\mathrm{H}}^{2}+\frac{1}{4 \beta} T|f|_{\mathrm{H}}^{2}+(\beta-\alpha) \mathbb{E} \int_{0}^{t}|u(s)|_{\mathrm{H}}^{2} d s . \tag{6.9}
\end{align*}
$$

Now using the assumption (H3) ${ }^{\prime}$ in (6.9), we obtain

$$
\begin{aligned}
& \frac{1}{2} \mathbb{E}|u(t)|_{\mathrm{H}}^{2}+\delta \mathbb{E} \int_{0}^{t}|\nabla u(s)|_{L^{2}}^{2} d s+(\alpha-\beta) \mathbb{E} \int_{0}^{t}|u(s)|_{\mathrm{H}}^{2} d s \\
& \quad \leq \frac{1}{2}\left|u_{0}\right|_{\mathrm{H}}^{2}+\frac{1}{4 \beta} T|f|_{\mathrm{H}}^{2} .
\end{aligned}
$$

Choosing $\beta=\frac{\alpha}{2}$ yields

$$
\begin{aligned}
& \frac{1}{2} \mathbb{E}|u(t)|_{\mathrm{H}}^{2}+\delta \mathbb{E} \int_{0}^{t}|\nabla u(s)|_{L^{2}}^{2} d s+\frac{\alpha}{2} \mathbb{E} \int_{0}^{t}|u(s)|_{\mathrm{H}}^{2} d s \\
& \quad \leq \frac{1}{2}\left|u_{0}\right|_{\mathrm{H}}^{2}+\frac{1}{2 \alpha} T|f|_{\mathrm{H}}^{2} .
\end{aligned}
$$

Therefore for $\gamma=\min \left\{\frac{\alpha}{2}, \delta\right\}>0$,

$$
\frac{1}{2} \mathbb{E}|u(t)|_{\mathrm{H}}^{2}+\gamma \mathbb{E} \int_{0}^{t}\|u(s)\|_{\mathrm{V}}^{2} d s \leq \frac{1}{2}\left|u_{0}\right|_{\mathrm{H}}^{2}+\frac{1}{2 \alpha} T|f|_{\mathrm{H}}^{2}
$$

Thus, for any $T>0$, we infer that

$$
\begin{equation*}
\frac{1}{T} \int_{0}^{T} \mathbb{E}\|u(s)\|_{\mathrm{V}}^{2} d s \leq \frac{1}{2 \gamma T}\left|u_{0}\right|_{\mathrm{H}}^{2}+\frac{1}{4 \gamma^{2}}|f|_{\mathrm{H}}^{2} \tag{6.10}
\end{equation*}
$$

Using the Chebyshev inequality and inequality (6.10), we infer that for every $T \geq 0$

$$
\begin{aligned}
\frac{1}{T} \int_{0}^{T} \mathbb{P}\left(\left\{\left\|u\left(t, u_{0}\right)\right\|_{\mathrm{V}}>R\right\}\right) d t & \leq \frac{1}{T R^{2}} \int_{0}^{T} \mathbb{E}\|u(t)\|_{\mathrm{V}}^{2} d t \\
& \leq \frac{1}{R^{2}}\left[\frac{1}{2 \gamma T}\left|u_{0}\right|_{\mathrm{H}}^{2}+\frac{1}{4 \gamma^{2}}|f|_{\mathrm{H}}^{2}\right]
\end{aligned}
$$

Now for sufficiently large $R>0$ depending on $\varepsilon,\left|u_{0}\right|_{\mathrm{H}}$ and $|f|_{\mathrm{H}}$, the assertion follows.

### 6.2. Sequentially weak Feller property

We are left to verify the assumption (i) of Theorem 6.4, i.e. the Markov semigroup $\left\{T_{t}\right\}_{t \geq 0}$ is sequentially weakly Feller in V. In other words we want to show that for any $t>0$ and any bounded and weakly continuous $\varphi: \mathrm{V} \rightarrow$ $\mathbb{R}$, if $\xi_{n} \rightarrow \xi$ weakly in V , then

$$
\begin{equation*}
T_{t} \varphi\left(\xi_{n}\right) \rightarrow T_{t} \varphi(\xi) \tag{6.11}
\end{equation*}
$$

The second named author in his PhD thesis proved that the martingale solutions of stochastic constrained Navier-Stokes equations continuously depend on the initial data [14, Theorem 5.7.7]. We have a similar result for
time homogeneous damped tamed NSEs, which can be proved analogously, see also [10, Theorem 4.11].

Theorem 6.6. Assume that $\left(u_{0, n}\right)_{n=1}^{\infty}$ is a V-valued sequence that is convergent weakly to $u_{0} \in \mathrm{~V}$. Let

$$
\left(\Omega_{n}, \mathcal{F}_{n}, \mathbb{F}_{n}, \mathbb{P}_{n}, W_{n}, u_{n}\right)
$$

be a martingale solution of problem (6.1) on $[0, \infty)$ with the initial data $u_{0, n}$. Then for every $T>0$ there exist

- a subsequence $\left(n_{k}\right)_{k}$,
- a stochastic basis $(\widetilde{\Omega}, \widetilde{\mathcal{F}}, \widetilde{\mathbb{F}}, \widetilde{\mathbb{P}})$,
- an $\ell^{2}$-valued cylindrical Wiener process $\widetilde{W}(t)=\left(\widetilde{W}^{j}(t)\right)_{j=1}^{\infty}$,
- and $\widetilde{\mathbb{F}}$-progressively measurable processes $\widetilde{u},\left(\widetilde{u}_{n_{k}}\right)_{k \geq 1}$ (defined on this basis) with laws supported in $\mathcal{Z}_{T}$ such that
$\widetilde{u}_{n_{k}}$ has the same law as $u_{n_{k}}$ on $\mathcal{Z}_{T}$ and $\widetilde{u}_{n_{k}} \rightarrow \widetilde{u}$ in $\mathcal{Z}_{T}, \quad \widetilde{\mathbb{P}}$-a.s. (6.12) and the system

$$
(\widetilde{\Omega}, \widetilde{\mathcal{F}}, \widetilde{\mathbb{F}}, \widetilde{\mathbb{P}}, \widetilde{W}, \widetilde{u})
$$

is a martingale solution to problem (6.1) on the interval $[0, T]$ with the initial data $u_{0}$. In particular, for all $t \in[0, T]$ and all $\mathrm{v} \in \mathcal{V}$

$$
\begin{aligned}
& \langle\widetilde{u}(t), \mathrm{v}\rangle+\int_{0}^{t}\left\langle\mathrm{~A}_{\alpha} \widetilde{u}(s), \mathrm{v}\right\rangle d s+\int_{0}^{t}\langle B(\widetilde{u}(s)), \mathrm{v}\rangle d s \\
& \quad+\int_{0}^{t}\left\langle g\left(|\widetilde{u}(s)|^{2}\right) \widetilde{u}(s), \mathrm{v}\right\rangle d s \\
& =\langle\widetilde{u}(0), \mathrm{v}\rangle_{\mathrm{V}}+\int_{0}^{t}\langle f, \mathrm{v}\rangle d s+\left\langle\int_{0}^{t} \sum_{j=1}^{\infty} G_{j}(s, \widetilde{u}(s)) d W^{j}(s), \mathrm{v}\right\rangle, \quad \widehat{\mathbb{P}}-a . s .
\end{aligned}
$$

Moreover, the process $\widetilde{u}$ satisfies the following inequality

$$
\begin{equation*}
\widetilde{\mathbb{E}}\left[\sup _{s \in[0, T]}\|\widetilde{u}(s)\|_{\mathrm{V}}{ }^{2}+\int_{0}^{T}|\widetilde{u}(s)|_{\mathrm{D}(\mathrm{~A})}^{2} d s\right]<\infty . \tag{6.13}
\end{equation*}
$$

We will need the uniqueness in law of solutions of (6.1), which is defined next.

Definition 6.7. Let $\left(\Omega^{i}, \mathcal{F}^{i}, \mathbb{F}^{i}, \mathbb{P}^{i}, W^{i}, u^{i}\right), i=1,2$ be martingale solutions of (6.1) with $u^{i}(0)=u_{0}, i=1,2$. Then we say that the solutions are unique in law if

$$
\operatorname{law}_{\mathbb{P}^{1}}\left(u^{1}\right)=l a w_{\mathbb{P}^{2}}\left(u^{2}\right) \text { on } \mathcal{C}\left([0, \infty) ; \mathrm{V}_{w}\right) \cap L^{2}([0, \infty) ; \mathrm{D}(\mathrm{~A}))
$$

where $\operatorname{law}_{\mathbb{P}^{i}}\left(u^{i}\right), i=1,2$ are by definition probability measures on $\mathcal{C}\left([0, \infty) ; \mathrm{V}_{w}\right) \cap L^{2}([0, \infty) ; \mathrm{D}(\mathrm{A}))$.
Lemma 6.8. Assume that assumptions $(\mathbf{H} 1)^{\prime}-(\mathbf{H} 3)^{\prime}$ are satisfied. Then the martingale solution of (6.1) is unique in law.

The proof of the above lemma is the direct application of Theorems 2 and 11 of [28] once we have proved the existence of a pathwise unique martingale solution of (6.1); which follows from Theorem 6.2.

Lemma 6.9. The semigroup $\left\{T_{t}\right\}_{t \geq 0}$ is sequentially weakly Feller in V.
Proof. Let us choose and fix $0<t \leq T, \xi \in \mathrm{~V}$ and $\varphi: \mathrm{V} \rightarrow \mathbb{R}$ be a bounded weakly continuous function. Need to show that $T_{t} \varphi$ is sequentially weakly Feller in V. For this aim let us choose a V-valued sequence ( $\xi_{n}$ ) weakly convergent to $\xi$ in V. Since the function $T_{t} \varphi: V \rightarrow \mathbb{R}$ is bounded, we only need to prove (6.11).

Let $u_{n}(\cdot)=u\left(\cdot ; \xi_{n}\right)$ be a strong solution of $(6.1)$ on $[0, T]$ with the initial data $\xi_{n}$ and let $u(\cdot)=u(\cdot ; \xi)$ be a strong solution of (6.1) with the initial data $\xi$. We assume these processes are defined on the stochastic basis $(\Omega, \mathcal{F}, \mathbb{F}, \mathbb{P})$. By Theorem 6.6 there exist

- a subsequence $\left(n_{k}\right)_{k}$,
- a stochastic basis $(\widetilde{\Omega}, \widetilde{\mathcal{F}}, \widetilde{\mathbb{F}}, \widetilde{\mathbb{P}})$, where $\widetilde{\mathbb{F}}=\left\{\widetilde{\mathcal{F}}_{s}\right\}_{s \in[0, T]}$,
- an $\ell^{2}$-valued cylindrical Wiener process $\widetilde{W}(t)$ on $(\widetilde{\Omega}, \widetilde{\mathcal{F}}, \widetilde{\mathbb{F}}, \widetilde{\mathbb{P}})$,
- and progressively measurable processes $\widetilde{u}(s),\left(\widetilde{u}_{n_{k}}(s)\right)_{k \geq 1}, s \in[0, T]$ (defined on this basis) with laws supported in $\mathcal{Z}_{T}$, where
$\mathcal{Z}_{T}=\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{A})) \cap L^{2}\left(0, T ; \mathrm{H}_{l o c}\right) \cap \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)$,
such that
$\widetilde{u}_{n_{k}}$ has the same law as $u_{n_{k}}$ on $\mathcal{Z}_{T}$ and $\widetilde{u}_{n_{k}} \rightarrow \widetilde{u}$ in $\mathcal{Z}_{T}$, $\widetilde{\mathbb{P}}$-a.s.
and the system

$$
\begin{equation*}
(\widetilde{\Omega}, \widetilde{\mathcal{F}}, \widetilde{\mathbb{F}}, \widetilde{\mathbb{P}}, \widetilde{W}, \widetilde{u}) \tag{6.15}
\end{equation*}
$$

is a martingale solution to (6.1) on the interval $[0, T]$ with the initial data $\xi$.
In particular, by (6.14), $\widetilde{\mathbb{P}}$-almost surely

$$
\widetilde{u}_{n_{k}}(t) \rightarrow \widetilde{u}(t) \text { weakly in } \mathrm{V} .
$$

Since the function $\varphi: V \rightarrow \mathbb{R}$ is sequentially weakly continuous, we infer that $\widetilde{\mathbb{P}}$-a.s.,

$$
\varphi\left(\widetilde{u}_{n_{k}}(t)\right) \rightarrow \varphi(\widetilde{u}(t)) \text { in } \mathbb{R}
$$

Since the function $\varphi$ is also bounded, by the Lebesgue dominated convergence theorem we infer that

$$
\begin{equation*}
\lim _{k \rightarrow \infty} \widetilde{\mathbb{E}}\left[\varphi\left(\widetilde{u}_{n_{k}}(t)\right)\right]=\widetilde{\mathbb{E}}[\varphi(\widetilde{u}(t))] \tag{6.16}
\end{equation*}
$$

From the equality of laws of $\widetilde{u}_{n_{k}}$ and $u_{n_{k}}, k \in \mathbb{N}$, on the space $\mathcal{Z}_{T}$ we infer that $\widetilde{u}_{n_{k}}$ and $u_{n_{k}}$ have same laws on $\mathrm{V}_{w}$ and so

$$
\begin{equation*}
\widetilde{\mathbb{E}}\left[\varphi\left(\widetilde{u}_{n_{k}}(t)\right)\right]=\mathbb{E}\left[\varphi\left(u_{n_{k}}(t)\right)\right] \tag{6.17}
\end{equation*}
$$

On the other hand, the r.h.s. of (6.17) is equal by (6.2), to $T_{t} \varphi\left(\xi_{n_{k}}\right)$.

Since $u$, by assumption, is a martingale solution of (6.1) with the initial data $\xi$ and from the above, $\widetilde{u}$ is also a solution of (6.1) with the initial data $\xi$. Thus, by Lemma 6.8, we infer that
the processes $u$ and $\widetilde{u}$ have same law on the space $\mathcal{Z}_{T}$.
Hence

$$
\begin{equation*}
\widetilde{\mathbb{E}}[\varphi(\widetilde{u}(t))]=\mathbb{E}[\varphi(u(t))] \tag{6.18}
\end{equation*}
$$

As before, the r.h.s. of (6.18) is equal by (6.2), to $T_{t} \varphi(\xi)$. Thus, by (6.16), (6.17) and (6.18), we infer

$$
\lim _{k \rightarrow \infty} T_{t} \varphi\left(\xi_{n_{k}}\right)=T_{t} \varphi(\xi)
$$

Using the subsequence argument, we infer that the whole sequence $\left(T_{t} \varphi\left(\xi_{n}\right)\right)_{n \in \mathbb{N}}$ is convergent and

$$
\lim _{n \rightarrow \infty} T_{t} \varphi\left(\xi_{n}\right)=T_{t} \varphi(\xi)
$$

Proof of Theorem 6.1. The existence of an invariant measure is established by using Theorem 6.4, Lemmas 6.5 and 6.9. Hence the proof of Theorem 6.1 is complete.

Remark 6.10. It has been suggested to the authors by the referee, that there should exist an invariant measure for the original non-damped, tamed 3-D Navier-Stokes equations (1.1-1.3). We agree with the premises of this suggestion for which we are grateful, yet we have decided to postpone a detailed study of this issue till another publication. Note that the existence of a unique invariant measure for the non-damped tamed 3-D Navier-Stokes equations was established by Röckner and Zhang [31] in a bounded domain (3-D torus).

## Appendix A. Convergence of $P_{n}$

Lemma A.1. Let $\gamma>\frac{3}{2}$ and $P_{n}: \mathrm{H} \rightarrow \mathrm{H}_{n}$ be the orthogonal projection as given by (4.1) (for more details see Section 4). Then as $n \rightarrow \infty$
(i) $P_{n} \psi \rightarrow \psi$ in H for $\psi \in \mathrm{H}$,
(ii) $P_{n} \psi \rightarrow \psi$ in V for $\psi \in \mathrm{V}$,
(iii) $P_{n} \psi \rightarrow \psi$ in $\mathrm{V}_{\gamma}$ for $\psi \in \mathrm{V}_{\gamma}$.

Proof. Let $\psi \in \mathrm{H}$, then by (4.1) and Parseval's equality we have

$$
\begin{aligned}
& \left|P_{n} \psi-\psi\right|_{\mathrm{H}}^{2}=\int_{\mathbb{R}^{3}}\left|\mathcal{F}\left(P_{n} \psi\right)(\xi)-\hat{\psi}(\xi)\right|^{2} d \xi \\
& \quad=\int_{\mathbb{R}^{3}}\left|\mathbb{1}_{B_{n}}(\xi) \hat{\psi}(\xi)-\hat{\psi}(\xi)\right|^{2} d \xi=\int_{|\xi|>n}|\hat{\psi}(\xi)|^{2} d \xi
\end{aligned}
$$

Now since $\psi \in \mathrm{H}$ using Lebesgue dominated convergence theorem it can be shown that

$$
\lim _{n \rightarrow \infty} \int_{|\xi|>n}|\hat{\psi}(\xi)|^{2} d \xi=0
$$

which infers (i).
Let $\psi \in \mathrm{V}$, then by (4.1) and the definition of V -norm we get

$$
\begin{aligned}
& \left\|P_{n} \psi-\psi\right\|_{\mathrm{V}}^{2}=\int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)\left|\mathcal{F}\left(P_{n} \psi\right)(\xi)-\hat{\psi}(\xi)\right|^{2} d \xi \\
& =\int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)\left|\mathbb{1}_{B_{n}}(\xi) \hat{\psi}(\xi)-\hat{\psi}(\xi)\right|^{2} d \xi=\int_{|\xi|>n}\left(1+|\xi|^{2}\right)|\hat{\psi}(\xi)|^{2} d \xi
\end{aligned}
$$

Again using the Lebesgue dominated convergence theorem for $\psi \in \mathrm{V}$, we get

$$
\lim _{n \rightarrow \infty} \int_{|\xi|>n}\left(1+|\xi|^{2}\right)|\hat{\psi}(\xi)|^{2} d \xi=0
$$

thus proving (ii).
Let $\psi \in \mathrm{V}_{\gamma}$, then by (4.1) and the definition of $\mathrm{V}_{\gamma}$-norm we get

$$
\begin{aligned}
& \left\|P_{n} \psi-\psi\right\|_{\mathrm{V}_{\gamma}}^{2}=\int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)^{\gamma}\left|\mathcal{F}\left(P_{n} \psi\right)(\xi)-\hat{\psi}(\xi)\right|^{2} d \xi \\
& =\int_{\mathbb{R}^{3}}\left(1+|\xi|^{2}\right)^{\gamma}\left|\mathbb{1}_{B_{n}}(\xi) \hat{\psi}(\xi)-\hat{\psi}(\xi)\right|^{2} d \xi=\int_{|\xi|>n}\left(1+|\xi|^{2}\right)^{\gamma}|\hat{\psi}(\xi)|^{2} d \xi
\end{aligned}
$$

Similarly as before it can be shown that for $\psi \in \mathrm{V}_{\gamma}$,

$$
\lim _{n \rightarrow \infty} \int_{|\xi|>n}\left(1+|\xi|^{2}\right)^{\gamma}|\hat{\psi}(\xi)|^{2} d \xi=0
$$

which concludes the proof.

## Appendix B. Kuratowski theorem

The main objective of this appendix is to prove the following theorem (see [10, Lemma 4.2]).
Theorem B.1. Let $T>0$ and

$$
\mathcal{Z}_{T}=\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L^{2}\left(0, T ; \mathrm{H}_{l o c}\right) \cap L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{~A})) \cap \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right)
$$

Then the sets $\mathcal{C}([0, T] ; \mathrm{V}) \cap \mathcal{Z}_{T}, \mathcal{C}\left([0, T] ; \mathrm{H}_{n}\right) \cap \mathcal{Z}_{T}$ and $L^{2}(0, T ; \mathrm{D}(\mathrm{A})) \cap \mathcal{Z}_{\mathrm{T}}$ are Borel subsets of $\mathcal{Z}_{T}$.

The proof of the above theorem heavily relies on the following Kuratowski theorem [19].
Theorem B.2. Assume that $X_{1}, X_{2}$ are the Polish spaces with their Borel $\sigma$ fields denoted respectively by $\mathcal{B}\left(X_{1}\right), \mathcal{B}\left(X_{2}\right)$. If $\varphi: X_{1} \rightarrow X_{2}$ is an injective Borel measurable map then for any $E_{1} \in \mathcal{B}\left(X_{1}\right), E_{2}:=\varphi\left(E_{1}\right) \in \mathcal{B}\left(X_{2}\right)$.

We will also need following abstract results to prove Theorem B. 1
Lemma B.1. Let $X_{1}, X_{2}$ and $Z$ be topological spaces such that $X_{1}$ is a Borel subset of $X_{2}$. Then $X_{1} \cap Z$ is a Borel subset of $X_{2} \cap Z$, where $X_{2} \cap Z$ is a topological space too, with the topology given by

$$
\begin{equation*}
\tau\left(X_{2} \cap Z\right)=\left\{A \cap B: A \in \tau\left(X_{2}\right), B \in \tau(Z)\right\} \tag{B.1}
\end{equation*}
$$

Proof. Since the Borel $\sigma$-filed on $X_{2} \cap Z$ is the smallest $\sigma$-field generated by $\tau\left(X_{2} \cap Z\right)$, i.e. $\mathcal{B}\left(X_{2} \cap Z\right)=\sigma\left(\tau\left(X_{2} \cap Z\right)\right)$, in order to prove the lemma it is enough to show that $\forall Y \in \mathcal{B}\left(X_{1}\right)$

$$
\begin{equation*}
Y \cap Z \in \mathcal{B}\left(X_{2} \cap Z\right) \tag{B.2}
\end{equation*}
$$

Firstly, we show that (B.2) holds for all $Y \in \tau\left(X_{1}\right)$. Since $X_{1} \in \mathcal{B}\left(X_{2}\right)$, $X_{1} \subset X_{2}$ and has trace topology from $X_{2}$, i.e $\forall Y \in \tau\left(X_{1}\right)$ there exists a $C \in \tau\left(X_{2}\right)$ such that

$$
Y=C \cap X_{1} .
$$

As $X_{1} \in \mathcal{B}\left(X_{2}\right)$ there exists a countable collection $\left\{K_{i}\right\}_{i \in \mathbb{N}}$ of open subsets of $X_{2}$ such that

$$
X_{1}=\bigcup_{i \in \mathbb{N}} K_{i}
$$

Therefore,

$$
Y \cap Z=C \cap X_{1} \cap Z=C \cap\left(\bigcup_{i \in \mathbb{N}} K_{i}\right) \cap Z=\bigcup_{i \in \mathbb{N}}\left(C \cap K_{i}\right) \cap Z
$$

Since $C \in \tau\left(X_{2}\right)$, for every $i \in \mathbb{N}, C \cap K_{i}$ is open in $X_{2}$ and there exists a collection $\left\{B_{j}\right\}_{j \in \mathbb{N}} \in \tau\left(X_{2}\right)$ such that

$$
\bigcup_{i \in \mathbb{N}}\left(C \cap K_{i}\right)=\bigcup_{j \in \mathbb{N}} B_{j}
$$

Thus

$$
Y \cap Z=\bigcup_{j \in \mathbb{N}}\left(B_{j} \cap Z\right),
$$

and for every $j \in \mathbb{N}, B_{j} \cap Z \in \mathcal{B}\left(X_{2} \cap Z\right)$. Since $\mathcal{B}\left(X_{2} \cap Z\right)$ is a $\sigma$-field, the countable union also belongs to $\mathcal{B}\left(X_{2} \cap Z\right)$, proving (B.2) for every $Y \in \tau\left(X_{1}\right)$. Secondly, we implement the method of good sets to prove (B.2) for a larger class of subsets of $X_{1}$. Let

$$
\mathcal{G}=\left\{A \subset X_{1}: A \cap Z \in \mathcal{B}\left(X_{2} \cap Z\right)\right\}
$$

Claim: $\mathcal{G}$ is a $\sigma$-field.
i) $X_{1} \in \mathcal{G}$ since $X_{1} \subset X_{1}$ and $X_{1} \in \tau\left(X_{1}\right)$ by the definition of topology.
ii) Let $A \in \mathcal{G}$. We want to show that $A^{c}:=X_{1} \backslash A \in \mathcal{G}$, i.e. $A^{c} \subset X_{1}$ and $A^{c} \cap Z \in \mathcal{B}\left(X_{2} \cap Z\right)$. Since $A \in \mathcal{G}, A \subset X_{1}$ and $A \cap Z \in \mathcal{B}\left(X_{2} \cap Z\right)$. Clearly $A^{c}=X_{1} \backslash A \subset X_{1}$. Since $A \cap Z \in \mathcal{B}\left(X_{2} \cap Z\right)$, then by the definition of $\sigma$-field

$$
{ }^{c}(A \cap Z):=\left(X_{2} \cap Z\right) \backslash(A \cap Z) \in \mathcal{B}\left(X_{2} \cap Z\right) .
$$

We have the following set relations

$$
\begin{aligned}
{ }^{c}(A \cap Z) & ={ }^{c} A \cup{ }^{c} Z=\left[\left(X_{2} \cap Z\right) \backslash A\right] \cup\left[\left(X_{2} \cap Z\right) \backslash Z\right] \\
& =\left[\left(X_{2} \backslash A\right) \cap Z\right] \cup \emptyset=\left(X_{2} \backslash A\right) \cap Z \\
& =\left[A^{c} \cup\left(X_{2} \backslash X_{1}\right)\right] \cap Z \\
& =\left(A^{c} \cap Z\right) \cup\left[\left(X_{2} \backslash X_{1}\right) \cap Z\right]
\end{aligned}
$$

$$
=\left(A^{c} \cap Z\right) \cup^{c} X_{1}
$$

Now in the above identity ${ }^{c}(A \cap Z),{ }^{c} X_{1}$ belongs to $\mathcal{B}\left(X_{2} \cap Z\right)$ and hence $A^{c} \cap Z \in \mathcal{B}\left(X_{2} \cap Z\right)$, inferring $A^{c} \in \mathcal{G}$.
iii) Let $\left\{A_{i}\right\}_{i \in \mathbb{N}} \in \mathcal{G}$. Then $A_{i} \subset X_{1}$ for every $i \in \mathbb{N}$ hence

$$
\bigcup_{i \in \mathbb{N}} A_{i} \subset X_{1} .
$$

Also, the following holds

$$
\left(\bigcup_{i \in \mathbb{N}} A_{i}\right) \cap Z=\bigcup_{i \in \mathbb{N}}\left(A_{i} \cap Z\right) .
$$

Since $A_{i} \in \mathcal{G}, A_{i} \cap Z \in \mathcal{B}\left(X_{2} \cap Z\right)$ and as $\mathcal{B}\left(X_{2} \cap Z\right)$ is a $\sigma$-field

$$
\bigcup_{i \in \mathbb{N}}\left(A_{i} \cap Z\right) \in \mathcal{B}\left(X_{2} \cap Z\right)
$$

From $i$ ) $-i i i)$ we can infer that $\mathcal{G}$ is a $\sigma$-field. We have already shown that $\tau\left(X_{1}\right) \subset \mathcal{G}$ thus

$$
\mathcal{B}\left(X_{1}\right)=\sigma\left(\tau\left(X_{1}\right)\right) \subset \mathcal{G} .
$$

Therefore, we have shown that for every $Y \in \mathcal{B}\left(X_{1}\right), Y \cap Z \in \mathcal{B}\left(X_{2} \cap Z\right)$.
Lemma B.2. Let $X_{1}, X_{2}, Y$ be topological spaces such that $X_{1} \subset X_{2}, X_{1}$ has trace topology from $X_{2}$ and $X_{1} \cap Y=X_{2} \cap Y$ then

$$
\tau\left(X_{1} \cap Y\right)=\tau\left(X_{2} \cap Y\right)
$$

Proof. The topologies of $X_{1} \cap Y$ and $X_{2} \cap Y$ denoted by $\tau\left(X_{1} \cap Y\right)$ and $\tau\left(X_{2} \cap Y\right)$ respectively are given by

$$
\begin{aligned}
& \tau\left(X_{1} \cap Y\right)=\text { generated by }\left\{A \cap B: A \in \tau\left(X_{1}\right), B \in \tau(Y)\right\}, \\
& \tau\left(X_{2} \cap Y\right)=\text { generated by }\left\{C \cap B: C \in \tau\left(X_{2}\right), B \in \tau(Y)\right\}
\end{aligned}
$$

Since $X_{1}$ has a trace topology from $X_{2}$, for every $A \in \tau\left(X_{1}\right)$ there exists a $C \in \tau\left(X_{2}\right)$ such that $A=C \cap X_{1}$. Thus

$$
\tau\left(X_{1} \cap Y\right)=\text { generated by }\left\{C \cap X_{1} \cap B: C \in \tau\left(X_{2}\right), B \in \tau(Y)\right\}
$$

Thus all we are left to show is $C \cap X_{1} \cap B=C \cap B$ for every $C \in \tau\left(X_{2}\right)$ and $B \in \tau(Y)$. Since $X_{1} \cap Y=X_{2} \cap Y$, we have the following set relations

$$
\begin{aligned}
C \cap X_{1} \cap B & =\left(C \cap X_{1}\right) \cap(Y \cap B)=\left(C \cap X_{1} \cap Y\right) \cap B \\
& =\left(C \cap X_{2} \cap Y\right) \cap B=\left(C \cap X_{2}\right) \cap(Y \cap B)=C \cap B .
\end{aligned}
$$

We will need the following space:

$$
\begin{aligned}
L_{l o c}^{2}\left([0, T] \times \mathbb{R}^{3}\right)= & \left\{u:[0, T] \times \mathbb{R}^{3} \rightarrow \mathbb{R}^{3}\right. \\
& \text { s.t. } \left.\int_{0}^{T} \int_{|x| \leq R}|u(x, t)|^{2} d x d t<\infty, \forall R>0\right\} .
\end{aligned}
$$

$L_{l o c}^{2}\left([0, T] \times \mathbb{R}^{3}\right)$ is complete under the family of semi-norms

$$
\rho_{R}:=\left[\int_{0}^{T} \int_{|x| \leq R}|u(x, t)|^{2} d x d t\right]^{1 / 2}
$$

In particular, it is a Frechét space with the metric

$$
d(u, v)=\sum_{n \geq 1} \frac{1}{2^{n}} \frac{\rho_{n}(u-v)}{1+\rho_{n}(u-v)}
$$

Remark B.1. $L^{2}\left(0, T ; \mathrm{H}_{l o c}\right) \subset L_{l o c}^{2}\left([0, T] \times \mathbb{R}^{3}\right)$ and we can define a topology on $L^{2}\left(0, T ; \mathrm{H}_{\text {loc }}\right)$ by restricting the metric $d$ to $L^{2}\left(0, T ; \mathrm{H}_{\text {loc }}\right)$. Hence $L^{2}\left(0, T ; \mathrm{H}_{\text {loc }}\right)$ is a topological space with the trace topology from $L_{\text {loc }}^{2}([0, T] \times$ $\left.\mathbb{R}^{3}\right)$.

Let us define a new topological space:

$$
\widetilde{\mathcal{Z}}_{T}:=\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L_{l o c}^{2}\left([0, T] \times \mathbb{R}^{3}\right) \cap L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{~A})) \cap \mathcal{C}\left([0, T] ; \mathrm{V}_{w}\right) .
$$

Note that $\widetilde{\mathcal{Z}}_{T}$ and $\mathcal{Z}_{T}$ are same as a set. Because $L_{l o c}^{2}\left([0, T] \times \mathbb{R}^{3}\right) \cap$ $L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ and $L^{2}\left(0, T ; \mathrm{H}_{l o c}\right) \cap L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ are same as a set. $L^{2}\left(0, T ; \mathrm{H}_{l o c}\right) \subset$ $L_{l o c}^{2}\left([0, T] \times \mathbb{R}^{3}\right)$ and the only extra elements in $L_{l o c}^{2}\left([0, T] \times \mathbb{R}^{3}\right)$ are the ones which are locally square integrable but have non-zero divergence. But the intersection of $L_{l o c}^{2}\left([0, T] \times \mathbb{R}^{3}\right)$ with $L_{w}^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ eliminates those elements as the divergence free condition is imposed by the second set.

By Remark B. 1 and Lemma B. $2 \widetilde{\mathcal{Z}}_{T}$ and $\mathcal{Z}_{T}$ have the same topologies. Thus we will prove Theorem B. 1 for $\widetilde{\mathcal{Z}}_{T}$ instead of $\mathcal{Z}_{T}$.

Proof of Theorem B.1. First of all $\mathcal{C}([0, T] ; \mathrm{V}) \subset \mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L_{\text {loc }}^{2}([0, T] \times$ $\left.\mathbb{R}^{3}\right)$. Secondly, $\mathcal{C}([0, T] ; \mathrm{V})$ and $\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L_{\text {loc }}^{2}\left([0, T] \times \mathbb{R}^{3}\right)$ are Polish spaces. And finally, since V is continuously embedded in $\mathrm{U}^{\prime}$, the map

$$
i: \mathcal{C}([0, T] ; \mathrm{V}) \rightarrow \mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L_{l o c}^{2}\left([0, T] \times \mathbb{R}^{3}\right)
$$

is continuous and hence Borel. Thus, by application of the Kuratowski theorem (see Theorem B.2), $\mathcal{C}([0, T] ; \mathrm{V})$ is a Borel subset of $\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap L_{l o c}^{2}([0, T] \times$ $\left.\mathbb{R}^{3}\right)$. Therefore, by Lemma B. $1 \mathcal{C}([0, T] ; \mathrm{V}) \cap \widetilde{\mathcal{Z}}_{T}$ is a Borel subset of $\mathcal{C}\left([0, T] ; \mathrm{U}^{\prime}\right) \cap$ $L_{\text {loc }}^{2}\left([0, T] \times \mathbb{R}^{3}\right) \cap \widetilde{\mathcal{Z}}_{T}$ which is equal to $\widetilde{\mathcal{Z}}_{T}$. We can show in the same way in the case of $\mathcal{C}\left([0, T] ; \mathrm{H}_{n}\right) \cap \mathcal{Z}_{T}$.

Similarly we can show that $L^{2}(0, T ; D(A)) \cap \widetilde{\mathcal{Z}}_{\mathrm{T}}$ is a Borel subset of $\widetilde{\mathcal{Z}}_{T} . L^{2}(0, T ; \mathrm{D}(\mathrm{A})) \hookrightarrow \mathrm{L}_{\text {loc }}^{2}\left([0, \mathrm{~T}] \times \mathbb{R}^{3}\right)$ and both are Polish spaces thus by application of the Kuratowski theorem [Theorem B.2], $L^{2}(0, T ; \mathrm{D}(\mathrm{A}))$ is a Borel subset of $L_{l o c}^{2}\left([0, T] \times \mathbb{R}^{3}\right)$. Finally, we can conclude the proof of the theorem by Lemma B.1.
